BeneView T8

Patient Monitor

Operator’s Manual

CE Marking

The product bears CE mark indicating its conformity with the provisions of the Council Directive 93/42/EEC concerning medical devices and fulfils the essential requirements of Annex I of this directive.

The product is in radio-interference protection class A in accordance with EN55011.

The product complies with the requirement of standard EN 60601-1-2 “Electromagnetic Compatibility – Medical Electrical Equipment”.

Revision History

This manual has a revision number. This revision number changes whenever the manual is updated due to software or technical specification change. Contents of this manual are subject to change without prior notice.

- Revision number: 2.0
- Release time: 2007-10

⚠ WARNING

- **Federal Law (USA) restricts this device to sale by or on the order of a physician.**

Intellectual Property Statement

SHENZHEN MINDRAY BIO-MEDICAL ELECTRONICS CO., LTD. (hereinafter called Mindray) owns the intellectual property rights to this product and this manual. This manual may refer to information protected by copyrights or patents and does not convey any license under the patent rights of Mindray, nor the rights of others.

Mindray intends to maintain the contents of this manual as confidential information. Disclosure of the information in this manual in any manner whatsoever without the written permission of Mindray is strictly forbidden. Release, amendment, reproduction, distribution, rental, adaption and translation of this manual in any manner whatsoever without the written permission of Mindray is strictly forbidden.

, MINDRAY and BeneView are the registered trademarks or trademarks owned by Mindray in China and other countries. All other trademarks that appear in this manual are used only for editorial purposes without the intention of improperly using them. They are the property of their respective owners.

Contents of this manual are subject to changes without prior notice.

Manufacturer’s Responsibility

All information contained in this manual is believed to be correct. Mindray shall not be liable for errors contained herein nor for incidental or consequential damages in connection with the furnishing, performance, or use of this manual.

Mindray is responsible for the effects on safety, reliability and performance of this product, only if:

- all installation operations, expansions, changes, modifications and repairs of this product are conducted by Mindray authorized personnel; and
- the electrical installation of the relevant room complies with the applicable national and local requirements; and
- the product is used in accordance with the instructions for use.

Warranty

This warranty is exclusive and is in lieu of all other warranties, expressed or implied, including warranties of merchantability or fitness for any particular purpose.

Exemptions

Mindray's obligation or liability under this warranty does not include any transportation or other charges or liability for direct, indirect or consequential damages or delay resulting from the improper use or application of the product or the use of parts or accessories not approved by Mindray or repairs by people other than Mindray authorized personnel.

This warranty shall not extend to

- Any Mindray product which has been subjected to misuse, negligence or accident; or
- Any Mindray product from which Mindray's original serial number tag or product identification markings have been altered or removed; or
- Any product of any other manufacturer.

Return Policy

In the event that it becomes necessary to return a unit to Mindray, follow the instructions below.

1. Return authorization.

Contact the Customer Service Department and obtain a Customer Service Authorization number. This number must appear on the outside of the shipping container. Returned shipments will not be accepted if the number is not clearly visible. Please provide the model number, serial number, and a brief description of the reason for return.

2. Freight policy

The customer is responsible for freight charges when this product is shipped to Mindray for service (this includes customs charges).

3. Return address

Please send the part(s) or equipment to the address offered by the Customer Service Department.

Preface

Manual Purpose

This manual contains the instructions necessary to operate the product safely and in accordance with its function and intended use. Observance of this manual is a prerequisite for proper product performance and correct operation and ensures patient and operator safety.

This manual is based on the maximum configuration and therefore some contents may not apply to your product. If you have any question, please contact us.

This manual is an integral part of the product. It should always be kept close to the equipment so that it can be obtained conveniently when needed.

Intended Audience

This manual is geared for clinical professionals who are expected to have a working knowledge of medical procedures, practices and terminology as required for monitoring of critically ill patients.

Illustrations

All illustrations in this manual serve as examples only. They may not necessarily reflect the setup or data displayed on your patient monitor.

Conventions

- ***Italic*** text is used in this manual to quote the referenced chapters or sections.
- [ ] is used to enclose screen texts.
- → is used to indicate operational procedures.

FOR YOUR NOTES

Contents

1 Safety

1.1 Safety Information

⚠ DANGER

- **Indicates an imminent hazard that, if not avoided, will result in death or serious injury.**

⚠ WARNING

- **Indicates a potential hazard or unsafe practice that, if not avoided, could result in death or serious injury.**

⚠ CAUTION

- **Indicates a potential hazard or unsafe practice that, if not avoided, could result in minor personal injury or product/property damage.**

NOTE

- **Provides application tips or other useful information to ensure that you get the most from your product.**

1.1.1 Dangers

There are no dangers that refer to the product in general. Specific “Danger” statements may be given in the respective sections of this manual.

1.1.2 Warnings

⚠ WARNINGS

- **Before putting the system into operation, the operator must verify that the equipment, connecting cables and accessories are in correct working order and operating condition.**
- **The equipment must be connected to a properly installed power outlet with protective earth contacts only. If the installation does not provide for a protective earth conductor, disconnect it from the power line and operate it on battery power, if possible.**
- **To avoid explosion hazard, do not use the equipment in the presence of flammable anesthetics, vapors or liquids.**
- **Do not open the equipment housings. All servicing and future upgrades must be carried out by the personnel trained and authorized by our company only.**
- **When using the equipment with electrosurgical units (ESU), make sure the patient is safe.**
- **Do not come into contact with patients during defibrillation. Otherwise serious injury or death could result.**
- **Do not rely exclusively on the audible alarm system for patient monitoring. Adjustment of alarm volume to a low level or off may result in a hazard to the patient. Remember that alarm settings should be customized according to different patient situations and always keeping the patient under close surveillance is the most reliable way for safe patient monitoring.**
- **The physiological data and alarm messages displayed on the equipment are for reference only and cannot be directly used for diagnostic interpretation.**
- **To avoid inadvertent disconnection, route all cables in a way to prevent a stumbling hazard. Wrap and secure excess cabling to reduce risk of entanglement or strangulation by patients or personnel.**
- **Dispose of the package material, observing the applicable waste control regulations and keeping it out of children’s reach.**

1.1.3 Cautions

⚠ CAUTIONS

- **To ensure patient safety, use only parts and accessories specified in this manual.**
- **At the end of its service life, the equipment, as well as its accessories, must be disposed of in compliance with the guidelines regulating the disposal of such products. If you have any questions concerning disposal of the equipment, please contact us.**
- **Magnetic and electrical fields are capable of interfering with the proper performance of the equipment. For this reason make sure that all external devices operated in the vicinity of the equipment comply with the relevant EMC requirements. Mobile phone, X-ray equipment or MRI devices are a possible source of interference as they may emit higher levels of electromagnetic radiation.**
- **Before connecting the equipment to the power line, check that the voltage and frequency ratings of the power line are the same as those indicated on the equipment's label or in this manual.**
- **Always install or carry the equipment properly to avoid damage caused by drop, impact, strong vibration or other mechanical force.**

1.1.4 Notes

NOTES

- **Put the equipment in a location where you can easily see the screen and access the operating controls.**
- **Keep this manual in the vicinity of the equipment so that it can be obtained conveniently when needed.**
- **The software was developed in compliance with IEC60601-1-4. The possibility of hazards arising from software errors is minimized.**
- **This manual describes all features and options. Your equipment may not have all of them.**

1.2 Equipment Symbols

NOTE

- **Some symbols may not appear on your equipment.**

	Attention: Consult accompanying documents (this manual).		
	Power ON/OFF		Battery indicator
	Alternating current (AC)		Alarms paused
	System silenced		Record
	Freeze/unfreeze waveforms		Main menu
	NIBP start/stop key		Connector for satellite module rack
	Equipotential grounding		Video output
	USB connector		Network connector
	CIS connector		Auxiliary output connector
	Defibrillator connector		Zero key
	Check sensor		Calibrate key
	Measure/standby		Serial number
	Gas outlet		Manufacture date
	CIS connector		
	CE marking		
	European community representative		

	ESD warning symbol for electrostatic sensitive devices.
	Type CF applied part. Defibrillator-proof protection against electric shock.
	Type BF applied part. Defibrillator-proof protection against electric shock.
	The following definition of the WEEE label applies to EU member states only. This symbol indicates that this product should not be treated as household waste. By ensuring that this product is disposed of correctly, you will help prevent bringing potential negative consequences to the environment and human health. For more detailed information with regard to returning and recycling this product, please consult the distributor from whom you purchased it. * For system products, this label may be attached to the main unit only.

FOR YOUR NOTES

2 The Basics

2.1 Monitor Description

2.1.1 Intended Use

This patient monitor is intended to be used for monitoring, displaying, reviewing, storing and transferring of multiple physiological parameters including ECG, heart rate (HR), respiration (Resp), temperature (Temp), SpO_2, pulse rate (PR), non-invasive blood pressure (NIBP), invasive blood pressure (IBP), cardiac output (C.O.), carbon dioxide (CO_2), oxygen (O_2), anesthetic gas (AG), impedance cardiograph (ICG), bispectral index (BIS) and respiration mechanics (RM) of single adult, pediatric and neonatal patients.

ST-segment monitoring and C.O. monitoring are restricted to adult patients only. The ICG is only for use on adult patients who meet the following requirements: height: 122 to 229 cm, weight: 30 to 159 kg. 12-lead ECG and BIS monitoring are not intended for neonatal patients.

This monitor is to be used in healthcare facilities by clinical professionals or under their direction. It is not intended for helicopter transport, hospital ambulance, or home use.

⚠ WARNING

- **This patient monitor is intended for use only by clinical professionals or under their guidance. It must only be used by persons who have received adequate training in its use. Anyone unauthorized or untrained must not perform any operation on it.**

2.1.2 Contraindications

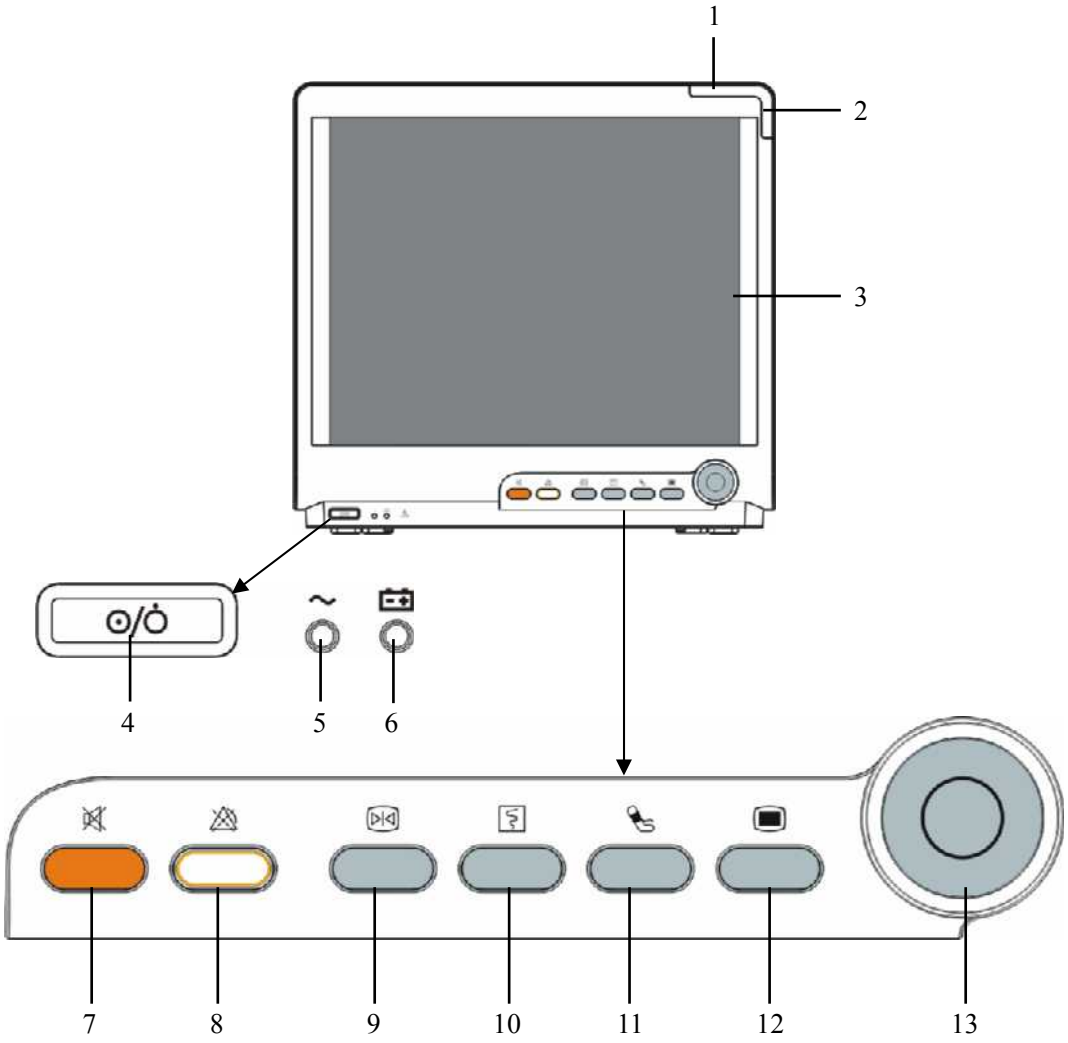
None.

2.1.3 Components

This patient monitor consists of a main unit, display, measurement module racks, SpO_2 sensor, NIBP cuff, IBP cables, C.O. cables, CO_2 components, AG components, RM components, BIS components, etc.

2.2 Main Unit

2.2.1 Front View



1. Physiological alarm lamp

   When a physiological alarm occurs, this lamp will flash as defined below.

   - High level alarms: the lamp quickly flashes red.
   - Medium level alarms: the lamp slowly flashes yellow.
   - Low level alarms: the lamp lights yellow without flashing.

2. Technical alarm lamp

   This lamp will light blue when a technical alarm occurs.

3. Display Screen

4. Power On/Off Switch

   Press this switch to turn the patient monitor on. Press it again and hold for 2 seconds to turn the patient monitor off. An indicator is built in this switch. It turns on when the patient monitor is on and turns off when the patient monitor is off.

5. AC power LED

   It turns on when AC power is connected.

6. Battery LED

   - On: when the battery is being charged or already fully charged.
   - Off: when no battery is installed or no AC source is connected.
   - Flash: when the patient monitor operates on battery power.

7. Press to silence all system sounds.

8. Press to pause, restore or clear alarms.

9. Press to freeze or unfreeze waveforms.

10. Press to start or stop recordings.

11. Press to start or stop NIBP measurements.

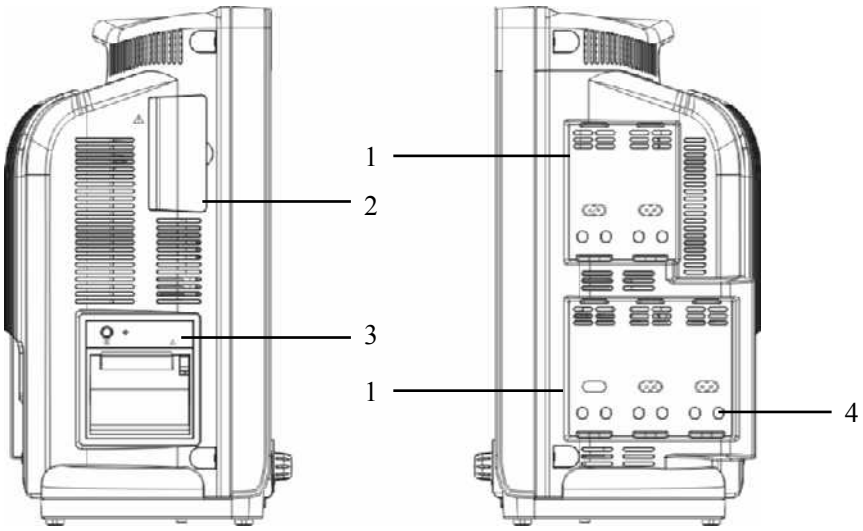
12.

    If no menu is displayed on the screen, pressing it will enter the main menu. If there is a menu displayed on the screen, pressing it will close that menu.

13. Knob

    Rotate the Knob clockwise or anti-clockwise. With each click, the highlight jumps to the neighboring item. When you reach your desired item, press the Knob to select it

2.2.2 Side View



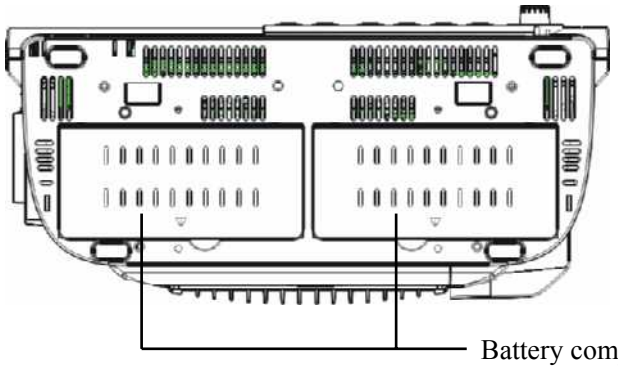
1. Integral Module Racks 2. Compartment for CF storage card slot

3. Recorder 4. Contact

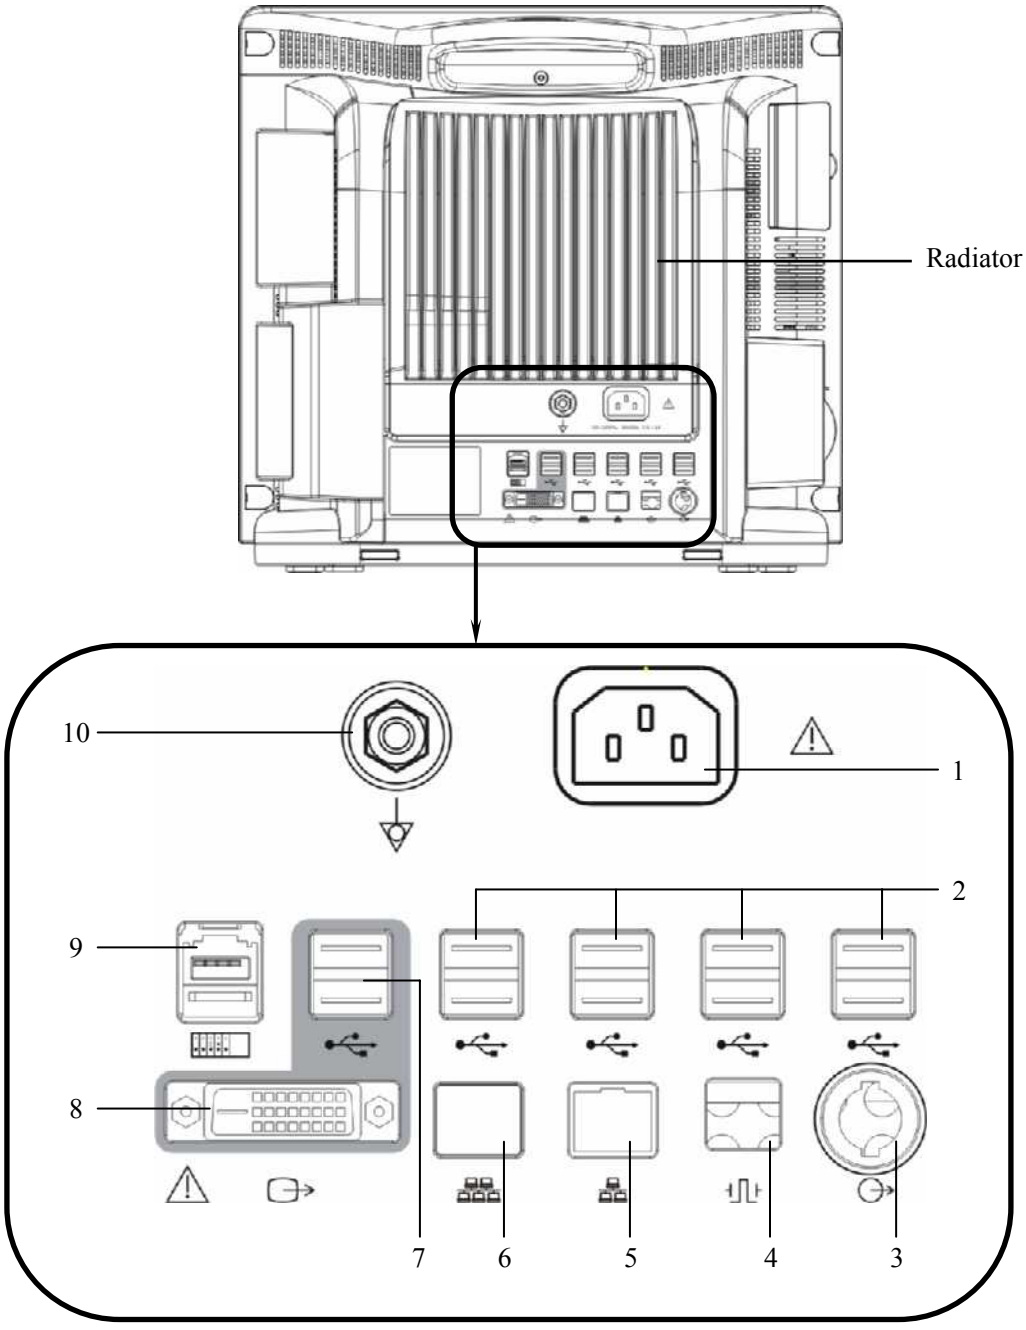
NOTE

- **To ensure a good contact, clean the contacts regularly, as dust and dirt may collect on them. When cleaning the contacts, wipe them with cotton, dampened with alcohol. (using forceps is recommended)**

2.2.3 Bottom View



2.2.4 Rear View



1. AC Power Input

2. USB Connectors

   They connect such devices as the USB mouse, USB keyboard, etc.

3. Auxiliary Output Connector

   It provides analog signals if an oscilloscope is connected or alarm signals if a nurse call system is connected.

4. Defib Sync Connector

   It provides synchronization signals if a defibrillator is connected.

5. Network Connector

   It is a standard RJ45 connector that connects the patient monitor to the CMS.

6. CIS Connector

   It is a standard RJ45 connector that connects the patient monitor to the hospital's clinical information system (CIS). The CIS feature is available in China only.

7. USB Connectors

   They connect the controlling devices (USB mouse and USB keyboard) of the secondary display.

8. Digital Video Interface (DVI)

   It connects a secondary display, which extends the display capability of your monitor. The secondary display can be independently operated and controlled, and also display the contents different from the monitor screen.

9. SMR Connector

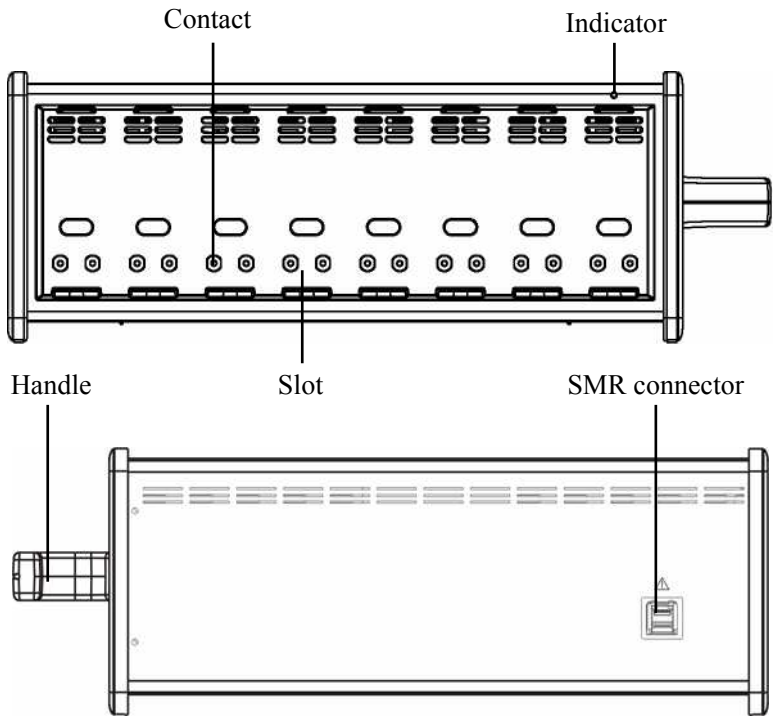
   It connects the satellite module rack (SMR).

10. Equipotential Grounding Terminal

    When the patient monitor and other devices are to be used together, their equipotential grounding terminals should be connected together, eliminating the potential difference between them.

2.3 Satellite Module Rack

The Satellite Module Rack (SMR) provides 8 slots for mounting measurement modules. The number of modules mounted in the SMR depends, as different modules may need different slots.



As shown in the figure above, there is an indicator telling the status of the SMR:

- On: when the SMR works normally.
- Off: when the SMR disconnects from the patient monitor, there is a problem with the power, or the patient monitor shuts down.

The SMR can be connected to the patient monitor through their SMR connectors via a SMR cable.

NOTE

- **To ensure a good contact, clean the contacts regularly, as dust and dirt may collect on them. When cleaning the contacts, wipe them with cotton, dampened with alcohol. (using forceps is recommended)**

2.4 Modules

As shown below, the patient monitor supports the following modules:

- MPM: Multi-parameter module. It can simultaneously monitor ECG, respiration, SpO_2, temperature, NIBP and IBP.
- IBP module: Invasive blood pressure module.
- C.O. module: Cardiac output module. (not available in USA)
- CO_2 module: Carbon dioxide module.
- AG module: Anaesthesia gas module. The functions of the O_2 and BIS modules can be incorporated into it.
- ICG module: Impedance cardiography module.
- BIS module: Bispectral index module.
- RM module: Respiration mechanics module.

Under the maximum configuration, the patient monitor has one two-slot module rack, one three-slot module rack and one satellite module rack. The number of modules mounted in the patient monitor depends, as different modules may need different slots.

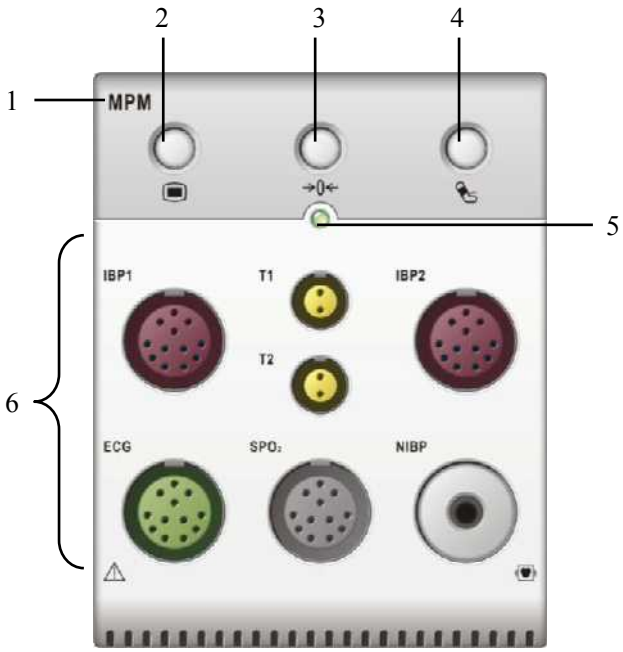
2.4.1 Plug-In Modules

You can plug and unplug modules during patient monitoring. To plug a module, insert the module until the lever on the module clicks into place and then push the lock key at the bottom in position to lock the module. To remove a module, release the lock key, press the lever upwards and pull the module out.

Make sure that the indicator on the module lights on after the module is plugged in. Otherwise, re-plug the module until the indicator lights on.

2.4.2 Multi-Parameter Module

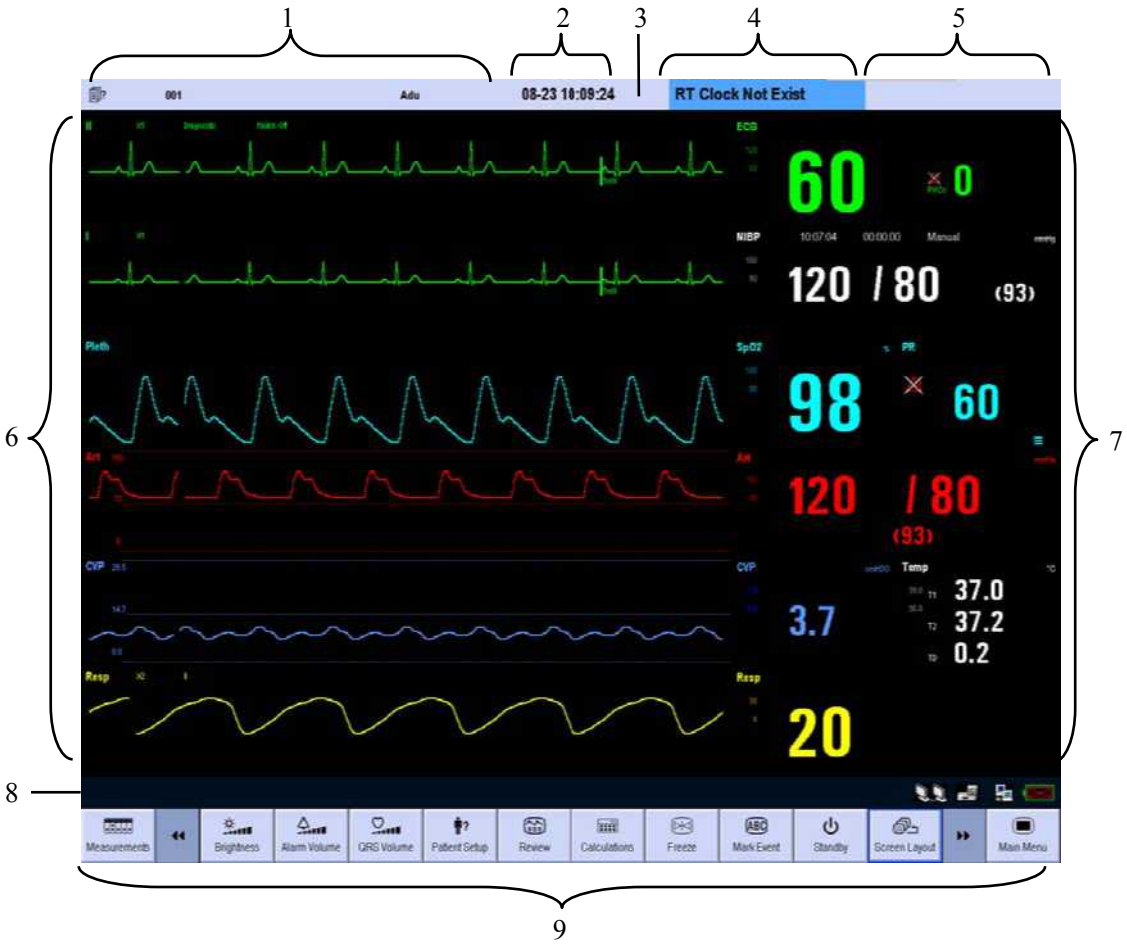
The multi-parameter module (MPM) incorporates multiple measurement modules. As shown below, the module name is located at the upper left corner, all hardkeys on the upper part, and all measurement connectors on the lower part. Other measurement modules look similar to the MPM.



1. Module name
2. Setup key: press to enter the [**MPM Setup**] menu.
3. Zero key: press to enter the [**Zero IBP**] menu.
4. NIBP start/stop key: press to start or stop NIBP measurements.
5. Indicator
   - On: when the patient monitor works correctly.
   - Flash: when the module is being initialized.
   - Off: when the module is either unconnected or broken.
6. Measurement connectors

2.5 Display Screen

This patient monitor adopts a high-resolution TFT LCD to display patient parameters and waveforms. A typical display screen is shown below.



1. Patient Information Area

   This area shows the patient information such as department, bed number, patient name, patient category and paced status.

   - : indicates that no patient is admitted or the patient information is incomplete.
   - : indicates that the patient has a pacer.

   If no patient is admitted, selecting this area will enter the [**Patient Setup**] menu. If a patient has been admitted, selecting this area will enter the [**Patient Demographics**] menu.

2. Date and Time

   This area shows the system time of the patient monitor. By selecting this area, you can enter the [**System Time**] setup menu.

3. Sound Symbols

   -  indicates alarms are paused.
   -  indicates all system sounds are turned off.
   -  indicates alarm sounds are turned off.

4. Technical Alarm Area

   This area shows technical alarm messages and prompt messages. When multiple messages come, they will be displayed circularly. Select this area and the technical alarm list will be displayed.

5. Physiological Alarm Area

   This area shows physiological alarm messages. When multiple alarms occur, they will be displayed circularly. Select this area and the physiological alarm list will be displayed.

6. Waveform Area

   This area shows measurement waveforms. The waveform name is displayed at the left upper corner of the waveform. Select this area and the corresponding waveform setup menu will be displayed.

7. Parameter Area

   This area shows measurement parameters. Each monitored parameter has a parameter window and the parameter name is displayed at the upper left corner. When this area cannot accommodate all parameters, the excess parameters will automatically occupy the waveform area from bottom to top. Select this area and the corresponding measurement setup menu will be displayed.

8. Prompt Message Area

   This area shows the prompt messages, network status icons, battery status icons, etc. For details about battery status symbols, refer to the chapter ***26 Batteries***.

   -  indicates patient monitor is connected to a wire network successfully.
   -  indicates the patient monitor has failed to connect a wire network.
   -  indicates a CF storage card is inserted.
   -  indicates a secondary display or remote display is connected.

9. QuickKeys area

   This area contains QuickKeys that give you fast access to functions.

2.6 QuickKeys

A QuickKey is a configurable graphical key, located at the bottom of the main screen. They give you fast access to functions. Their availability and the order in which they appear on your screen, depend on how your patient monitor is configured.

By default, the following QuickKeys are displayed on the screen:

Scroll left to display more QuickKeys.

Scroll right to display more QuickKeys.

Enter the measurement setup menu

Enter the main menu

Change screen brightness

Change alarm volume

Change QRS volume

Enter the patient setup menu

Review the patient's history data

Perform calculations

Freeze waveforms

Mark Event

Enter standby mode

Change screen

Start/stop NIBP measurements

Start NIBP STAT measurement

Zero IBP

 Start cardiac output procedure (not available in USA)

 View respiratory loops

 Enter the 12-lead analysis screen (not available in USA)

 Start/stop recordings

 Print

 Select parameter setup menu for the Big Numerics screen

 Have a split-screen view of another patient's conditions

You can also select your desired QuickKeys to display on the screen.

1. Select [**Main Menu**]→[**Maintenance** >>]→[**User Maintenance >>**]→enter the required password→[**Select QuickKeys >>**].
2. In the [**Select QuickKeys**] menu, select your desired QuickKeys.
3. Select [**Ok**].

Besides the default QuickKeys listed above, there are still more QuickKeys:

 Change alarm settings

 Quickly admit a patient

 Re-learn arrhythmia

 Have a split-screen view of oxyCRG trends

 Have a split-screen view of minitrends

 Enter the user maintenance menu

 Enter the analog output setup menu

 Change key volume

 Default configurations

 Enter the full-screen 7-lead ECG screen

 Switch on/off ST analysis

 Calibrate the touchscreen.

3 Basic Operations

3.1 Installation

⚠ WARNING

- **The equipment shall be installed by personnel authorized by us.**
- **The software copyright of the equipment is solely owned by us. No organization or individual shall resort to juggling, copying, or exchanging it or to any other infringement on it in any form or by any means without due permission.**
- **Devices connected to the equipment must meet the requirements of the applicable IEC standards (e.g. IEC 60950 safety standards for information technology equipment and IEC 60601-1 safety standards for medical electrical equipment). The system configuration must meet the requirements of the IEC 60601-1-1 medical electrical systems standard. Any personnel who connect devices to the equipment's signal input/output port is responsible for providing evidence that the safety certification of the devices has been performed in accordance to the IEC 60601-1-1. If you have any question, please contact us.**
- **If it is not evident from the equipment specifications whether a particular combination is hazardous, for example, due to summation of leakage currents, consult the manufacturers or else an expert in the field, to ensure the necessary safety of all devices concerned will not be impaired by the proposed combination.**

3.1.1 Unpacking and Checking

Before unpacking, examine the packing case carefully for signs of damage. If any damage is detected, contact the carrier or us.

If the packing case is intact, open the package and remove the equipment and accessories carefully. Check all materials against the packing list and check for any mechanical damage. Contact us in case of any problem.

NOTE

- **Save the packing case and packaging material as they can be used if the equipment must be reshipped.**

⚠ WARNING

- **When disposing of the packaging material, be sure to observe the applicable waste control regulations and keep it out of children's reach.**
- **The equipment might be contaminated during storage and transport. Before use, please verify whether the packages are intact, especially the packages of single use accessories. In case of any damage, do not apply it to patients.**

3.1.2 Environmental Requirements

The operating environment of the equipment must meet the requirements specified in this manual.

The environment where the equipment is used shall be reasonably free from noises, vibration, dust, corrosive, flammable and explosive substances. If the equipment is installed in a cabinet, sufficient space in front and behind shall be left for convenient operation, maintenance and repair. Moreover, to maintain good ventilation, the equipment shall be at least 2 inches (5cm) away from around the cabinet.

When the equipment is moved from one place to another, condensation may occur as a result of temperature or humidity difference. In this case, never start the system before the condensation disappears.

⚠ WARNING

- **Make sure that the operating environment of the equipment meets the specific requirements. Otherwise unexpected consequences, e.g. damage to the equipment, could result.**

3.2 Getting Started

3.2.1 Turning Power On

Once the patient monitor is installed, you can get ready for monitoring:

1. Before you start to make measurements, check the patient monitor, SMR and plug-in modules for any mechanical damage and make sure that all external cables, plug-ins and accessories are properly connected.
2. Plug the power cord into the AC power source. If you run the patient monitor on battery power, ensure that the battery is sufficiently charged.
3. Press the power on/off switch on the monitor's front. The technical and physiological alarm lamps turn blue and red respectively. The system gives a beep after the start-up screen is displayed, and at the same time, the physiological alarm lamp turns yellow and then turns off together with the technical alarm lamp.
4. The monitor enters the main screen.

⚠ WARNING

- **Do not use the patient monitor for any monitoring procedure on a patient if you suspect it is not working properly, or if it is mechanically damaged. Contact your service personnel or us.**

3.2.2 Starting Monitoring

1. Decide which measurements you want to make.
2. Connect the required modules, patient cables and sensors.
3. Check that the patient cables and sensors are correctly connected.
4. Check that the patient settings such as [**Patient Cat.**], [**Paced**], etc, are appropriate for your patient.
5. Refer to the appropriate measurement section for details of how to perform the measurements you require.

3.3 Disconnecting from Power

To disconnect the patient monitor from the AC power source, follow this procedure:

1. Confirm that the patient monitoring is finished.
2. Disconnect the patient cables and sensors from the patient monitor.
3. Make sure to save or clear the patient monitoring data as required.
4. Press and hold the power on/off switch for above 2 seconds. The patient monitor shuts down and you can unplug the power cable. If the patient monitor does not shut down properly, press and hold the power on/off switch for 4 seconds to shut it down.

⚠ CAUTION

- **It is not recommended to shut the patient monitor down by pressing the power on/off switch for 4 seconds, as this may cause damage to the patient monitor.**

3.4 Using a mouse

You can use the USB mouse supplied with the equipment as a monitor input device. The USB mouse can be plugged and unplugged with the monitor on.

When you are using a mouse:

- By default, the left mouse-button is the primary button and the right one the secondary button.
- Clicking the primary button equals to pressing the knob or selecting the touchscreen.
- The secondary button is disabled.

You can also define the right mouse-button as the primary button by following this procedure:

1. Select [**Main Menu**]→[**Maintenance >>**]→[**User Maintenance >>**]→enter the required password.
2. Select [**Others >>**] to enter the [**Others**] menu.
3. Select [**Primary Button**] and then select [**Right**] from the popup list.

3.5 Using Keyboards

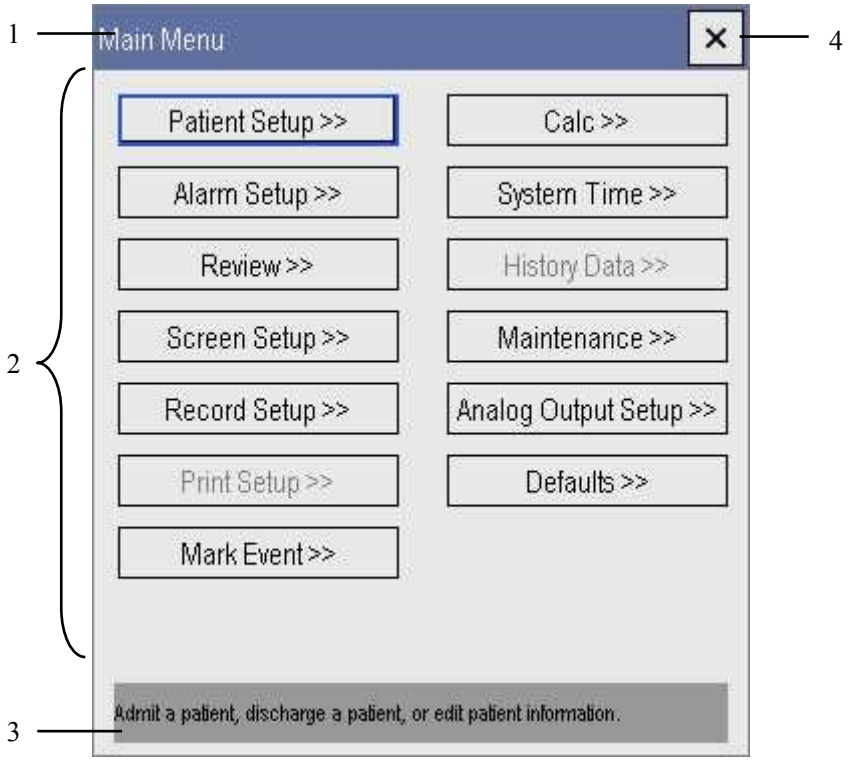
The on-screen keyboard enables you to enter information. Use the [**Back**] key to delete the previously entered character. Use the [**Caps**] to toggle between uppercase and lowercase letters. Select [**Enter**] to confirm what you have entered and close the on-screen keyboard.

3.6 Using the Touchscreen

Select screen items by pressing them directly on the patient monitor's screen. You can enable or disable touchscreen operation by pressing and holding the [**Measurement]** QuickKey for 3 seconds. A padlock symbol  is displayed if touchscreen operation is disabled.

3.7 Using the Main Menu

To enter the main menu, select the on-screen QuickKey or the hardkey on the monitor's front. Most of monitor operations and settings can be performed through the main menu.



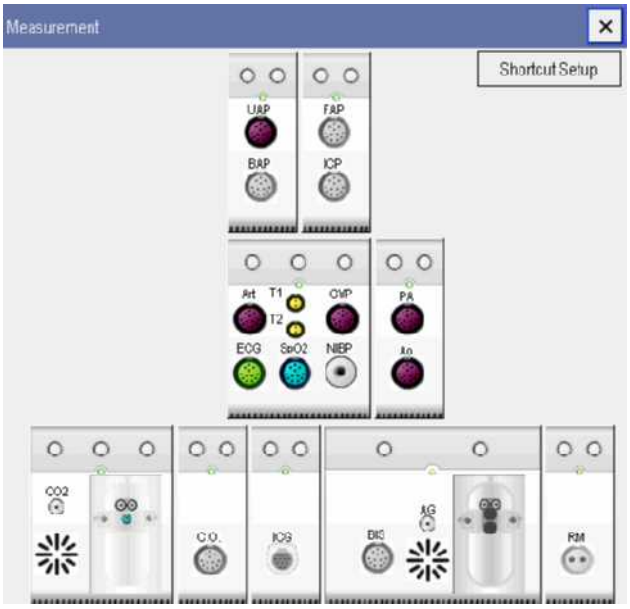
Other menus are similar to the main menu and contain the following parts:

1. Heading: gives a sum-up for the current menu.
2. Main body: displays options, buttons, prompt messages, etc. The menu button with ">>'' enlarges a secondary window to reveal more options or information.
3. Online help area: displays help information for the screen item to which the cursor points.
4. ✕: select to exit the current menu.

3.8 Setting Measurements

3.8.1 Accessing the Measurements Menu

Select the [**Measurement**] QuickKey in the lower left corner of the screen to enter the menu as shown below. Your display may be configured to look slightly different depending on the modules mounted.



This menu displays the measurement modules mounted in the two-slot module rack, three-slot module rack and satellite module rack from top to bottom. The module name is located at each measurement connector whose color indicates the status of the specific module.

 (colored) indicates that the module is turned on.

 (grey) indicates that the module is turned off.

 indicates a module name conflict.

 indicates a module error.

3.8.2 Activating/Stopping Measurements

The procedures for activatting/stopping different measurements are slightly different. The following takes FAP as an example.

- To activate an FAP measurement which is currently off : select the corresponding measurement from the [**Measurement**]menu and then select [**Activate FAP**] from the pop-up menu.
- To stop an FAP measurment which is currently activated : select the corresponding measurement from the [**Measurement**] menu and then select [**FAP Setup**]→[**Stop FAP**].

In addition, you can select [**Shortcut Setup**] from the [**Measurement**] menu, and then set the status of all measurements once for all in the pop-up menu.

3.8.3 Removing a Module Conflict

Besides three independent IBP modules and the IBP module on the MPM, the patient monitor supports only one more measurement module simultaneously. Otherwise, the message of module conflict will de prompted.

For example, if a CO_2 module (module A) is already loaded and then another CO_2 module (module B) is inserted, your patient monitor will then display module conflict. To use module A, just pull out module B. To use module B, pull both modules A and B out and then re-insert module B.

3.8.4 Removing a Label Conflict

Every label is unique and is assigned only once. The measurement label is stored inside the module. The system will prompt module name conflict when two measurement modules with the same name are used.

For example, an IBP module (module A) is already loaded and the Art label is used for module A. Then another IBP module (module B) is inserted and the Art label is also used for module B. In this case, your patient monitor will prompt the message of label conflict and display the [**Label**] menu.

- To use module A for Art measurement, just modify the label of module B on this channel in the [**Label**] menu. If the [**Label**] menu already exits inadvertently, you need to plug out and then plug in module B.

- To use module B for Art measurement, first exit the [**Label**] menu. Then select the Art parameter area on the screen and modify the label of module A on this channel in the popup menu. Finally, plug out and then plug in module B.

3.9 Using a CF Storage Card

A CF storage card is used to prevent data loss in case of a sudden power failure. The patient data such as trend data, waveform data, etc., will be automatically saved into the CF storage card during patient monitoring. In case of a sudden power failure, the patient data can be retrieved from the CF storage card after the patient monitor restarts.

Switching the patient monitor off before inserting or removing a CF card is a must. To insert a CF storage card, open the compartment and then insert the card until the button flips out. To remove the CF storage card, take the stick attached with the cover and use it to press the button until the CF storage card flips out.

To browse the data saved in the CF storage card, follow this procedure:

1. Select [**Main Menu**]→[**History Data >>**].
2. Select a patient whose data you want to view from the [**Patient Data List**] and then select [**Review**].
3. In the [**Review**] menu, select the data you want to review.

As reviewing the history patient's data is just like reviewing the current patient's data, you can refer to the chapter ***21 Review*** for details

NOTE

- **Data may be unable to be saved into the CF storage card when the patient monitor is just turned on.**
- **If no CF stroage card is used, all the data you have saved will get lost in case of monitor shut-down or sudden power interrupt.**

⚠ CAUTION

- **To avoid electrostatics, do not come into contact with the CF storage card when the patient monitor is on.**
- **Do not insert or remove the CF storage card when the patient monitor is on. Otherwise it may cause damage to the CF storage card and the patient monitor.**
- **Never apply the CF storage card to those other than the patient monitor.**

3.10 Changing General Settings

This chapter covers only general settings such as language, brightness, date and time, etc. Measurement settings and other settings can be referred to in respective sections.

3.10.1 Setting up a Monitor

In situations where you install a patient monitor or change the patient monitor's application site, you need to setup the patient monitor as follows:

1. Select [**Main Menu**]→[**Maintenance >>**]→[**User Maintenance >>**]→enter the required password.
2. In the [**User Maintenance**] menu, select, in turn, [**Monitor Name**], [**Department**] and [**Bed No.**], and then change their settings.

3.10.2 Changing Language

1. Select [**Main Menu**]→[**Maintenance >>**]→[**User Maintenance >>**]→enter the required password.
2. In the [**User Maintenance**] menu, select [**Language**] and then select the desired language.
3. Restart the patient monitor.

3.10.3 Adjusting the Screen Brightness

1. Select the [**Brightness**] QuickKey, or [**Main Menu**]→[**Screen Setup >>**]→ [**Brightness**].
2. Select the appropriate setting for the screen brightness. 10 is the brightest, and 1 is the least bright.

If the patient monitor operates on battery power, you can set a less bright screen to prolong the operating time of the battery. When the patient monitor enters standby mode, the screen will be adjusted to the least brightness automatically.

3.10.4 Showing/Hiding the Help

The patient monitor provides online help information. The user can display or hide the help as required.

1. Select [**Main Menu**]→[**Screen Setup** >>].
2. Select [**Help**] and toggle between [**On**] and [**Off**].

3.10.5 Setting the Date and Time

1. Select [**Main Menu**]→[**System Time** >>].
2. Set the date and time.
3. Select [**Date Format**] and toggle between [**yyyy-mm-dd**], [**mm-dd-yyyy**] and [**dd-mm-yyyy**].
4. Select [**Time Format**] and toggle between [**24h**] and [**12h**].

If your patient monitor is connected to a central monitoring system (CMS), the date and time are automatically taken from that CMS. In that case, you cannot change the date and time settings on your patient monitor.

⚠ CAUTION

- **Changing date and time will affect the storage of trends and events and may cause data missing.**

3.10.6 Adjusting Volume

Alarm Volume

1. Select the [**Alm Volume**] QuickKey, or [**Main Menu**]→[**Alarm Setup** >>].
2. Select [**Alm Volume**] and then select the appropriate volume. X is the minimum volume, which depends on the setting of minimum alarm volume (refer to the chapter Alarm), and 10 is the maximum volume.

Key Volume

1. Select the [**Key Volume**] QuickKey, or [**Main Menu**]→[**Screen Setu**p >>].
2. Select [**Key Volume**] and then select the appropriate volume. 0 means off, and 10 is the maximum volume.

QRS Volume

The QRS tone is derived from either the HR or PR, depending on which is currently selected as the alarm source in [**ECG Setup**] or [**PR Setup**]. When monitoring SpO_2, there is a variable pitch tone which changes as the patient's saturation level changes. The pitch of the tone rises as the saturation level increases and falls as the saturation level decreases. The volume of this tone is user adjustable.

1. Select the [**QRS Volume**] QuickKey, or the ECG or SpO_2 parameter window→[**PR Setup** >>].
2. Select [**Beat Vol**] and then select the appropriate volume. 0 means off, and 10 is the maximum volume.

3.11 Managing Configurations

3.11.1 Restoring the Latest Configuration Automatically

In actual applications, the operator may change some settings. However, these changes may not be saved as user configuration. To prevent the changes from losing upon power failure, the patient monitor will save the settings in real time. The saved settings are just the latest configuration. If the monitor restarts within 60 seconds after a power failure, the latest configuration is restored automatically. If the power failure lasts for more than 120 seconds, what the monitor restores may not be the latest configuration but the default configuration. However, if the power failure time comes between 60 to 120 seconds, the monitor will restore either the latest configuration or the default configuration.

3.11.2 Setting Startup Default Configuration

When the patient monitor restarts after being powered off for more than 120 seconds, it will restore the system configuration according to the set default configuration. The default configuration can be either the latest configuration or factory or user configuration.

To set startup default configuration:

1. Select [**Main Menu**]→[**Maintenance** >>]→[**User Maintenance** >>]→enter the required password→[**Manage Configuration** >>].
2. Select [**Select Default Config.** >>].
3. In the [**Select Default Config.**] menu, toggle between [**Load Last Config.**] and [**Load Specified Config.**].

When you select [**Load Specified Config.**], the configuration (adult, pediatric or neonate) to be restored is subject to the patient category. This configuration can be either factory configuration or saved user configuration. Take adult as an example, select [**Default Adu Config.**] and toggle between [**Factory Default Adu Config.**] or user configuration(s).

NOTE

- **To know what configuration is restored when the patient monitor starts, enter the main screen to check the prompt information at the lower part of the screen (displayed for about 10 seconds).**

3.11.3 Saving as User Configuration

You can change monitor settings as required and then save the changed settings as user configuration. This patient monitor can save multiple user configurations, and you can name the saved user configurations.

1. Change monitor setting as required and make sure that the changes are suitable for your patient.
2. Select [**Main Menu**]→[**Maintenance**>>]→[**User Maintenance** >>]→enter the required password→[**Manage Configuration** >>].
3. Select [**Save as User Default Config.** >>].
4. Enter a name and select [**Save**]. If the entered name already exists, a message box will appear. Proceed by following the message.

The configuration name saved in the patient monitor is in the form of "entered name+patient category+Config". e.g., if you enter the name "ICU1" and the current patient is an adult, the configuration name will be "ICU1 Adult Config".

3.11.4 Deleting a User Default Configuration

You can delete an existed user configuration.

1. Select [**Main Menu**]→[**Maintenance**>>]→[**User Maintenance** >>]→enter the required password→[**Manage Configuration** >>].
2. Select [**Delete User Default Config.** >>].
3. Select the configuration to be deleted. Select [**Delete**] and then select [**Yes**] from the popup menu.

3.11.5 Restoring Default Configuration Manually

You may make changes to some settings in some occasions. However, these changes may not be appropriate or correct, especially when a new patient is admitted. Therefore, in actual applications, you should restore the default configuration as required so as to ensure that the applied configuration is suitable for your patient.

To restore a certain default configuration:

1. Select [**Main Menu**]→[**Defaults** >>].
2. Select a factory or user configuration.
3. Select [**Yes**].

4 Managing Patients

4.1 Admitting a Patient

The patient monitor displays physiological data and stores them in the trends as soon as a patient is connected. This allows you to monitor a patient that is not admitted yet. However, it is recommended that you fully admit a patient so that you can clearly identify your patient, on recordings, reports and networking devices.

To admit a patient:

1. Select the [**Patient Setup**] QuickKey, or [**Main Menu**]→[**Patient Setup >>**].
2. Select [**Discharge Patient**] to clear any previous patient data. If you do not erase data from the previous patient, the new patient's data will be saved into the data of the previous patient. The monitor makes no distinction between the old and the new patient data.
3. If [**Discharge Patient**] button appears dimmed, directly select [**Admit Patient**] and then select:
   - [**Yes**] to apply the data saved in the patient monitor to the new patient, or
   - [**No**] to clear the data saved in the patient monitor.
4. In the [**Patient Demographics**] menu, enter the demographic details, of which:
   - [**Patient Cat.**] determines the way your patient monitor processes and calculates some measurements, and what safety and alarm limits are applied for your patient.
   - [**Paced**] determines whether to show pace pulse marks on the ECG waveform. When the [**Paced**] is set to [**No**], pace pulse marks are not shown in the ECG waveform.
5. Select [**Ok**].

⚠WARNING

- **[Patient Cat.] and [Paced] will always contain a value, regardless of whether the patient is fully admitted or not. If you do not specify settings for these fields, the patient monitor uses the default settings from the current configuration, which might not be correct for your patient.**
- **For paced patients, you must set [Paced] to [Yes]. If it is incorrectly set to [No], the patient monitor could mistake a pace pulse for a QRS and fail to alarm when the ECG signal is too weak.**
- **For non-paced patients, you must set [Paced] to [No]. If it is incorrectly set to [Yes], the patient monitor may be unable to detect premature ventricular beats (including PVCs) and perform ST segment analysis.**

4.2 Quick Admitting a Patient

Use [**Quick Admit**] only if you do not have the time or information to fully admit a patient. Complete the rest of the patient demographic details later. Otherwise, the  symbol will always be displayed in the patient information area.

1. Select the [**Patient Setup**] QuickKey, or [**Main Menu**]→[**Patient Setup >>**].
2. Select [**Discharge Patient**] to clear any previous patient data. If you do not erase data from the previous patient, the new patient's data will be saved into the data of the previous patient. The monitor makes no distinction between the old and the new patient data.
3. If [**Discharge Patient**] button appears dimmed, directly select [**Admit Patient**] and then select:
   - ◆ [**Yes**] to apply the data in your patient monitor to the new patient, or
   - ◆ [**No**] to clear any previous patient data**.**
4. Enter the patient category and paced status for the new patient, and then select [**Ok**].

4.3 Editing Patient Information

To edit the patient information after a patient has been admitted, or when the patient information is incomplete, or when you want to change the patient information:

1. Select the [**Patient Setup**] QuickKey, or [**Main Menu**]→[**Patient Setup >>**].
2. Select [**Patient Demographics**] and then make the required changes.
3. Select [**Ok**].

4.4 Discharging a Patient

To discharge a patient:

1. Select the [**Patient Setup**] QuickKey, or [**Main Menu**]→[**Patient Setup >>**].
2. Select [**Discharge Patient**]. In the popup menu, you can either:
   - Directly select [**Ok**] to discharge the current patient, or
   - Select [**Standby**] then [**Ok**]. The patient monitor enters the standby mode after discharging the current patient, or
   - Select [**Cancel**] to exit without discharging the patient.

NOTE

- **Discharging a patient clears all history data in the monitor.**

4.5 Connecting to a Central Monitoring System

If your patient monitor is connected to a central monitoring system (CMS):

- All patient information, measurement data and settings on the patient monitor can be transferred to the CMS.
- All patient information, measurement data and settings can be displayed simultaneously on the patient monitor and CMS. For some functions such as editing patient information, admitting a patient, discharging a patient, starting/stopping NIBP measurements, etc., bi-directional control can be achieved between your patient monitor and the CMS.

For details, refer to the CMS's instructions for use.

5 User Screens

5.1 Tailoring Your Screens

You can tailor your patient monitor's screens by setting:

- Waveform sweep mode
- Wave line size
- The color in which each measurement's numerics and waveform are displayed
- The parameter to be monitored.

Changing some settings may be hazardous. Therefore, those setting are password-protected and can be modified by authorized personnel only. Once change is made, those who use the patient monitor should be notified.

5.1.1 Setting the Waveform Sweep Mode

1. Select [**Main Menu**]→[**Screen Setup** >>].
2. Select [**Sweep Mode**] and toggle between [**Refresh**] and [**Scroll**].
   - [**Refresh**]: The waveforms keep stationary, being refreshed from left to right by a moving "erase bar".
   - [**Scroll**]: The waveforms move from the right to the left with time passing by.

5.1.2 Changing the Wave Line Size

1. Select [**Main Menu**]→[**Maintenance** >>]→[**User Maintenance** >>]→enter the required password.
2. Select [**Others** >>].
3. Select [**Wave Line**] and toggle between [**Thick**], [**Mediate**] and [**Thin**].

5.1.3 Changing Measurement Colors

1. Select [**Main Menu**]→[**Screen Setup** >>]→[**Measurement Color Setup** >>].
2. Select the color box next to your desired measurement and then select a color from the popup menu.

5.1.4 Selecting Measurement Parameters

Your can select your desired measurement parameters for monitoring by following this procedure:

1. Select the [**Measurement**] QuickKey.
2. Select the required parameters from the popup menu.
3. Close the popup menu. Your selections will be automatically applied.

Additionally, you can close a waveform or turn off a measurement. To close a waveform, select your desired waveform and then select [**Close Wave**] from the popup menu. To turn off a measurement, select your desired measurement parameter window, for example, the ECG parameter window, and then select [**Stop ECG**] from the popup menu.

5.1.5 Substituting or Adding a Wave

You can substitute individual waves or add a wave to display.

To substitute individual waveforms:

1. Select the wave segment (e.g. wave A) on the monitor where you want a new wave to appear. This calls up a popup menu.
2. Select [**Change Wave**] and then select a wave (e.g. wave B) you want. The wave A is substituted by the wave B. If the wave B is displayed on the screen before you make the change, the wave A will be automatically displayed in its original position.

To add a new wave for display:

1. Select the wave segment on the monitor below which you want to add a new wave. This calls up a popup menu.
2. Select [**Add Wave**] and then select a wave you want. Then, your newly selected wave is automatically added.

5.1.6 Changing Screen Layout

1. Select the [**Screens**] QuickKey, or [**Main Menu**]→[**Screen Setup >>**]→[**Screen Layout >>**].
2. Select a normal screen. “Factory default” means that the parameters are displayed in a pre-defined order and the order cannot be changed by the user.
3. You can also select a split-screen functional view if necessary. But the functional view is not available with the big numerics screen.

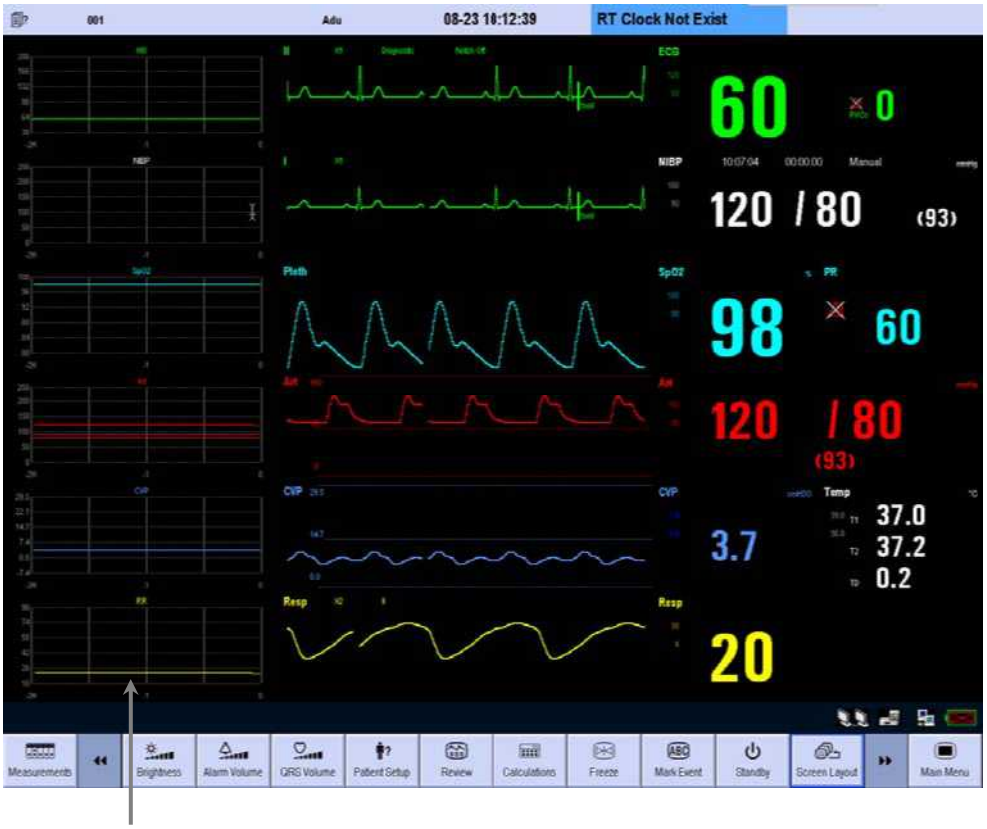
5.2 Viewing Minitrends

5.2.1 Having a Split-Screen View of Minitrends

You can split the normal screen so that one part of the screen, on the left hand side, continuously shows graphic minitrends beside waveforms as shown in the figure below.

To have a split-screen view of minitrends, you can:

- Select [**Minitrends**] QuickKey, or
- Select [**Screens**] QuickKey→[**Minitrends**]→[**Ok**], or
- Select [**Main Menu**]→[**Screen Setup** >>]→[**Screen Layout** >>]→[**Minitrends**]→[**Ok**].



The split-screen view provides minitrends for multiple parameters. In each field, the label, scale and time are respectively displayed at the top, left, and bottom as shown below.

5.2.2 Changing Minitrend Length

You can change the minitrend length for individual parameters. Take HR for example:

1. Select the HR field.
2. In the [**Minitrend Setup**] menu, select [**Minitrend Length**] and then choose [**1 h**], [**2 h**], [**4 h**] or [**8 h**].
3. Select the ✕ button.

5.2.3 Changing a Parameter for Viewing

In each field, you can change a parameter to view its minitrends. Take HR for example:

1. Select the HR field.
2. In the [**Minitrend Setup**] menu, select [**PVCs**], or [**Other Parameters** >>] and then select the desired parameter.
3. Select the ✕ button.

5.3 Viewing oxyCRG

To have a split screen view of oxyCRG, you can:

- Select [**oxyCRG**] QuickKey, or
- Select [**Screens**] QuickKey→[**oxyCRG**]→[**Ok**], or.
- Select [**Main Menu**]→[**Screen Setup** >>]→[**Screen Layout** >>]→[**oxyCRG**]→[**Ok**].

The split-screen view covers the lower part of the waveform area and shows HR trend, SpO_2 trend and RR trend (or Resp wave). At the bottom, there are controls:

1. Trend length list box

   In the trend length list box, you can select [**1 min**], [**2 min**], [**4 min**], or [**8 min**].

2. Resp Wave (or RR Trend) list box

   From this list box, you can select either [**Resp Wave**] or [**RR Trend**] for display.

3. Record

   Through this button, you can print out the currently displayed oxyCRG trends by the recorder.

5.4 Viewing Other Patients

5.4.1 Care Group

You can select up to 16 bedside monitors into a Care Group. This lets you:

- View information on the monitor screen from another bed in the same Care Group.
- Be notified of physiological and technical alarm conditions at the other beds in the same Care Group.

To have a Care Group:

1. Open the [**View Other Patient**] window by:
   - Selecting [**Others**] QuickKey, or
   - Selecting [**Screens**] QuickKey→[**Others**]→[**Ok**], or
   - Selecting [**Main Menu**]→[**Screen Setup** >>]→[**Screen Layout** >>]→[**Others**]→[**Ok**].
2. Select [**Setup**] in the [**View Other Patient**] window.
3. Select the desired bedside monitors from the [**Connected Monitor List**], and then select the ✕ button. The selected bedside monitors constitute a Care Group.

5.4.2 Understanding the View Other Patient Window

When you first open the [**View Other Patient**] window, the patient monitor automatically selects a monitor from the network to display in the [**View Other Patient**] window.

The [**View Other Patient**] window covers the lower part of the waveform area and consists of:

1. Information Area: shows the patient information (including department, bed number, patient name, etc.) and network status symbols.
2. View Area: shows physiological waveforms and parameters. You can switch a waveform area to a parameter area by selecting your desired waveform area and then selecting [**Switch to Parameter Area**], or switch a parameter area to a waveform area by selecting your desired parameter area and then selecting [**Switch to Waveform Area**].
3. Care Group: shows the bedside monitors you select for viewing through the [**View Other Patient**] window. The color a bedside monitor appears in matches its status:
   - Red: indicates the patient monitor is giving high-level physiological alarms.
   - Yellow: indicates the patient monitor is giving medium- or low-level physiological alarms.
   - Blue: indicates the patient monitor is giving technical alarms.
   - Grey: indicates the patient monitor fails to be networked or stays in the standby mode.

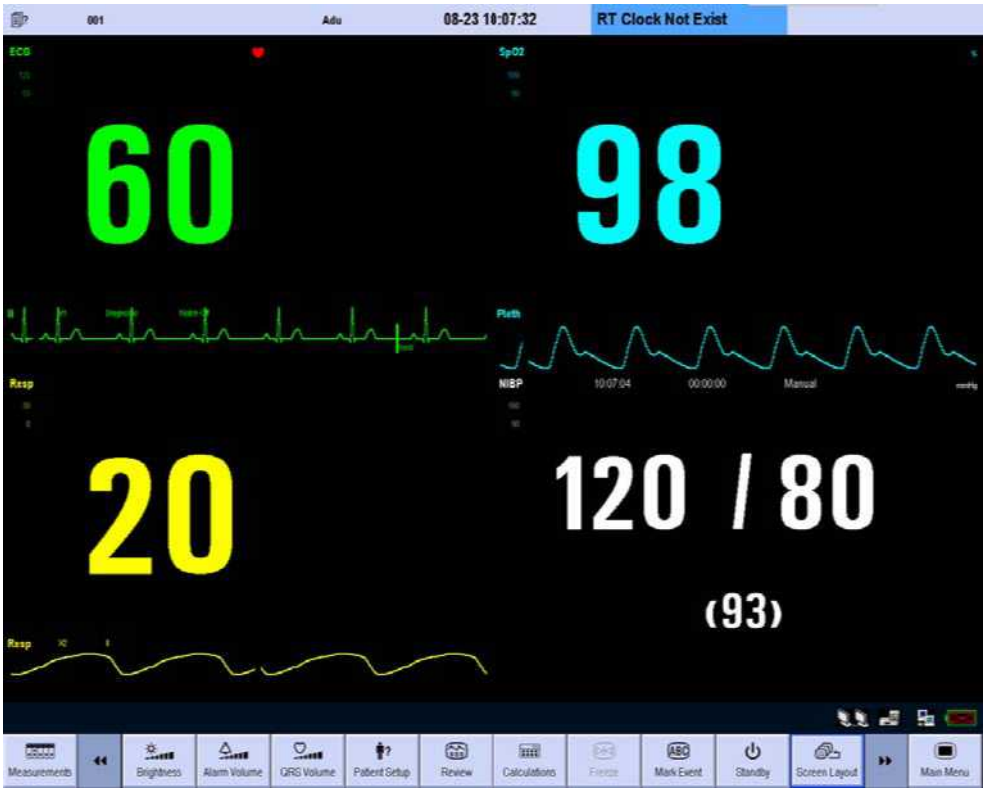
   You can view a patient monitor's alarms by selecting it from the care group, and furthermore, you can select the [**View This Patient**] button to view this patient monitor in the [**View Other Patient**] window.
4. Message Area: shows physiological and technical messages from the currently viewed patient. By selecting this area, you can enter the [**Alarm Information List**] to view all physiological, technical and prompt messages coming from the currently viewed patient.

Additionally, you can change a waveform or parameter for viewing. To change a waveform for viewing, select the waveform segment where you want a new waveform to appear and then select the waveform you want from the popup menu. To change a parameter for viewing, select the parameter window where you want a new parameter to appear and then select the parameter you want from the popup menu.

5.5 Understanding the Big Numerics Screen

To enter the big numerics screen:

1. Select the [**Screens**] QuickKey, or [**Main Menu**]→[**Screen Setup** >>]→[**Screen Layout** >>].
2. Select [**Big Numerics**] or [**Factory Default Big Numerics**]→[**Ok**].



You can select your desired parameters to display in this screen: select the [**Para. Setup**] QuickKey and then select the parameters you want. For parameters having a waveform, the waveform will also be displayed.

6 Alarms

Alarms, triggered by a vital sign that appears abnormal or by technical problems of the patient monitor, are indicated to the user by visual and audible alarm indications.

⚠WARNING

- **A potential hazard can exist if different alarm presets are used for the same or similar equipment in any single area, e.g. an intensive care unit or cardiac operating room.**
- **If your patient monitor is connected to a CMS, remote suspension, inhibition, silence and reset of monitor alarms via the CMS will not be protected.**

6.1 Alarm Categories

By nature, the patient monitor's alarms can be classified into three categories: physiological alarms, technical alarms and prompt messages.

1. Physiological alarms

   Physiological alarms, also called patient status alarms, are triggered by a monitored parameter value that violates set alarm limits or an abnormal patient condition. Physiological alarm messages are displayed in the physiological alarm area.

2. Technical alarms

   Technical alarms, also called system status alarms, are triggered by a device malfunction or a patient data distortion due to improper operation or mechanical problems. Technical alarm messages are displayed in the technical alarm area.

3. Prompt messages

   As a matter of fact, prompt messages are not alarm messages. Apart from the physiological and technical alarm messages, the patient monitor will show some messages telling the system status. Messages of this kind are included into the prompt message category and usually displayed in the prompt information area. But for some measurements, their related prompt messages are displayed in their respective parameter windows.

6.2 Alarm Levels

By severity, the patient monitor's alarms can be classified into three categories: high level alarms, medium level alarms and low level alarms.

1. High level alarms

   Indicate that your patient is in a life threatening situation and an emergency treatment is demanded.

2. Medium level alarms

   Indicate that your patient's vital signs appear abnormal and an immediate treatment is required.

3. Low level alarms

   Indicate that you patient's vital signs appear abnormal and an immediate treatment may be required.

All technical alarms are low level alarms. The level for all technical alarms and some physiological alarms are predefined before the patient monitor leaves the factory and cannot be changed. But for some physiological alarms, the level is user adjustable.

6.3 Alarm Indicators

When an alarm occurs, the patient monitor will indicate it to the user through visual or audible alarm indications.

- Alarm lamp
- Alarm message
- Flashing numeric
- Audible alarm tones

6.3.1 Alarm Lamp

If a technical alarm occurs, the technical alarm lamp will turn blue. If a physiological alarm occurs, the physiological alarm lamp will flash. The flashing color and frequency match the alarm level as follows:

- High level alarms: the lamp quickly flashes red.
- Medium level alarms: the lamp slowly flashes yellow.
- Low level alarms: the lamp turns yellow without flashing.

6.3.2 Alarm Message

When an alarm occurs, an alarm message will appear in the technical or physiological alarm area. For physiological alarms, the asterisk symbols (*) before the alarm message match the alarm level as follows:

- High level alarms: ***
- Medium level alarms: **
- Low level alarms: *

Additionally, the alarm message uses different background color to match the alarm level:

- High level alarms: red
- Medium level alarms: yellow
- Low level alarms: yellow

For technical alarm messages, their background highlights in blue. When the technical alarm area shows prompt messages, the background keeps blank. You can view the alarm messages by selecting the physiological or technical alarm area.

6.3.3 Flashing Numeric

If an alarm triggered by an alarm limit violation occurs, the numeric of the measurement in alarm will flash every second, and the corresponding alarm limit will also flash at the same frequency indicating the high or low alarm limit is violated.

6.3.4 Audible Alarm Tones

The patient monitor uses different alarm tone patterns to match the alarm level:

- High level alarms: triple+double+triple+double beep.
- Medium level alarms: triple beep.
- Low level alarms: single beep.

NOTE

- **When multiple alarms of different levels occur simultaneously, the patient monitor will select the alarm of the highest level and give visual and audible alarm indications accordingly.**

6.3.5 Alarm Status Symbols

Apart from the aforementioned alarm indicators, the patient monitor still uses the following symbols telling the alarm status:

-  indicates alarms are paused.
-  indicates all system sounds are silenced.
-  indicates the alarm sound is turned off.
-  indicates individual measurement alarms are turned off.

6.4 Alarm Tone Configuration

6.4.1 Setting the Minimum Alarm Volume

1. Select [**Main Menu**]→[**Maintenance** >>]→[**User Maintenance** >>]→enter the required password.
2. Select [**Alarm Setup** >>] to enter the [**Alarm Setup**] menu.
3. Select [**Minimum Alarm Volume**] and toggle between 0 and 10.

Minimum alarm volume decides the minimum value to be set for alarm volume, which is not affected by user or factory default configurations. The setting of minimum alarm volume remains unchanged when the patient monitor is shut down and restarted.

6.4.2 Changing the Alarm Volume

1. Select the [**Alm Setup**] QuickKey, or [**Main Menu**]→[**Alarm Setup** >>].
2. Select the appropriate volume from [**Alm Volume**]: X-10, in which X is the minimum volume, depending on the setting of minimum alarm volume, and 10 the maximum volume.

When alarm volume is set to 0, the alarm sound is turned off and a  symbol appears on the screen. The alarm volume returns to 2 automatically when:

- The patient monitor is shut down and then restarted.
- A certain user configuration which saves alarm volume as 0 is restored.
- The factory default configuration is restored.
- The  or  keys are pressed twice.

6.4.3 Setting the Interval between Alarm Sounds

1. Select [**Main Menu**]→[**Maintenance** >>]→[**User Maintenance** >>]→enter the required password.
2. Select [**Alarm Setup** >>] to enter the [**Alarm Setup**] menu.
3. Select [**High Alarm Interval (s)**], [**Med Alarm Interval (s)**] and [**Low Alarm Interval (s)**] in turn and then select the appropriate settings.

⚠ WARNING

- **When the alarm sound is switched off, the patient monitor will give no audible alarm tones even if a new alarm occurs. Therefore the user should be very careful about whether to switch off the alarm sound or not.**
- **Do not rely exclusively on the audible alarm system for patient monitoring. Adjustment of alarm volume to a low level may result in a hazard to the patient. Always keep the patient under close surveillance.**

6.5 Using Alarms

6.5.1 Switching Individual Measurement Alarms On/Off

1. Select the parameter window for your desired measurement to enter its setup menu.
2. Select [**Alarm**] and toggle between [**On**] and [**Off**].
   - [**On**]: The patient monitor gives alarm indications in accordance with the preset alarm level and stores the related waveforms and parameters.
   - [**Off**]: The alarm off symbol "  " is displayed in the measurement parameter window.

6.5.2 Setting the Alarm Level

1. Select the parameter window for your desired measurement to enter its setup menu.
2. Select [**Alm Lev**] and toggle between [**High**], [**Med**] and [**Low**].

6.5.3 Adjusting Alarm Limits

To adjust alarm limits for individual measurements:

1. Select the parameter window for your desired measurement to enter its setup menu.
2. In the setup menu, select the alarm limit you want to change and then select the appropriate settings.

⚠ WARNING

- **Make sure that the alarm limit settings are appropriate for your patient prior to monitoring.**

6.5.4 Recording Alarms Automatically

When a measurement alarm occurs, automatic recording of all the measurement numerics and related waveforms is possible when the measurement's [**Alarm**] and [**Alm Rec**] are set on.

To switch automatic start of alarm recording on or off for individual measurements, you can either:

1. In the setup menu for your desired measurement, select [**Alm Rec**] and toggle between [**On**] and [**Off**], or
2. Select [**Main Menu**]→[**Alarm Setup >>**]→[**Alarm Recordings >>**]. In the [**Alarm Recordings**] menu, select your desired measurement and toggle between [**On**] and [**Off**].

Additionally, you can change the length of the recorded waveforms. In the [**Alarm Setup**] menu, select [**Recording Length**] and toggle between [**8 s**], [**16 s**] and [**32 s**]:

- [**8 s**]: 4 seconds respectively before and after the alarm trigger moment.
- [**16 s**]: 8 seconds respectively before and after the alarm trigger moment.
- [**32 s**]: 16 seconds respectively before and after the alarm trigger moment.

6.6 Pausing Alarms

If you want to temporarily prevent alarms from sounding, you can pause alarms by pressing the hardkey on the monitor's front. When alarms are paused:

- No alarm lamps flash and no alarms are sounded.
- No numeric and alarm limit flash.
- No alarm messages are shown.
- The remaining pause time is displayed in the physiological alarm area.
- The  alarms paused symbol is displayed in the sound symbol area.

When the alarm pause time expires or a new technical alarm occurs, the alarm paused status is automatically cancelled and the alarm tone will sound. You can also cancel the alarm paused status by pressing the hardkey.

You can set the alarm pause time as desired. The default alarm pause time is 2 minutes.

1. Select [**Main Menu**]→[**Maintenance** >>]→[**User Maintenance** >>]→enter the required password.
2. Select [**Alarm Setup** >>]→[**Alarm Pause Time**] and then select the appropriate setting from the popup list.

6.7 Silencing the System

You can silence all system sounds by pressing the hardkey on the monitor's front. In that case, will be displayed in the sound symbol area indicating all system sounds are silenced. During system silence time, all alarm indicators except audible alarm tones behave correctly. You can press the hardkey again to cancel the system silenced status. When a new alarm occurs, the system silenced status will be automatically cancelled.

6.8 Latching Alarms

The alarm latching setting for your patient monitor defines how the alarm indicators behave when you do not acknowledge them. When alarms are set to non-latching, their alarm indications end when the alarm condition ends. If you switch alarm latching on, all visual and audible alarm indications last until you acknowledge the alarms, except that the measurement numeric and violated alarm limit stop flashing as soon as the initial alarm condition goes away.

To set alarms to latching or non-latching:

1. Select [**Main Menu**]→[**Maintenance** >>]→[**User Maintenance** >>]→enter the required password.
2. Select [**Alarm Setup** >>].
3. Select [**Latching Alarms**] and toggle between [**Yes**] and [**No**].

Technical alarms are always non-latching. You can clear the latched alarms by pressing the hardkey.

6.9 Clearing Technical Alarms

For some technical alarms, their alarm lamp flashing and alarm tones are cleared and the alarm messages change to prompt messages after the hardkey is pressed. After the patient monitor restores the normal status, the patient monitor can give alarm indications correctly when these alarms are triggered again.

For some other technical alarms, all their alarm indications are cleared after the hardkey is pressed. After the patient monitor restores the normal status, the patient monitor can give alarm indications correctly when these alarms are triggered again.

6.10 When an Alarm Occurs

When an alarm occurs, observe the following steps and take proper actions:

1. Check the patient's condition.
2. Confirm the alarming parameter or alarm category.
3. Identify the source of the alarm.
4. Take proper action to eliminate the alarm condition.
5. Make sure the alarm condition is corrected.

For troubleshooting specific alarms, see appendix ***Alarm Messages***.

FOR YOUR NOTES

7 Monitoring ECG

7.1 Introduction

The electrocardiogram (ECG) measures the electrical activity of the heart and displays it on the patient monitor as a waveform and a numeric. This patient monitor measures ECG using the MPM module. ECG monitoring provides two algorithms:

1. Basic algorithm

   The Basic algorithm enables 3-, 5- and 12-lead ECG monitoring, ST-segment analysis, arrhythmia analysis and 12-lead analysis.

2. Mortara algorithm

   The Mortara algorithm enables 3-, 5- and 12-lead ECG monitoring, ST-segment analysis and arrhythmia analysis.

You can select either algorithm as required. For the patient monitor incorporating the Mortara algorithm, 12-lead analysis in the Basic algorithm is optional.

The MPM module incorporating Mortara algorithm is labelled with the logo of Mortara.

7.2 Safety

⚠ WARNING

- **Use only ECG electrodes and cables specified in this manual.**
- **When connecting electrodes and/or patient cables, make sure that the connectors never come into contact with other conductive parts, or with earth. In particular, make sure that all of the ECG electrodes are attached to the patient, to prevent them from contacting conductive parts or earth.**
- **Periodically inspect the electrode application site to ensure skin quality. If the skin quality changes, replace the electrodes or change the application site.**
- **Use defibrillator-proof ECG cables during defibrillation.**
- **Do not touch the patient, or table, or instruments during defibrillation.**
- **After defibrillation, the screen display recovers within 10 seconds if the correct electrodes are used and applied in accordance with the manufacturer's instructions for use.**
- **Interference from a non-grounded instrument near the patient and electrosurgery interference can cause problems with the waveform.**

7.3 Preparing to Monitor ECG

7.3.1 Preparing the Patient and Placing the Electrodes

1. Prepare the patient's skin. Proper skin preparation is necessary for good signal quality at the electrode, as the skin is a poor conductor of electricity. To properly prepare the skin, choose flat, non-muscular areas and then follow this procedure:
   - ◆ Shave hair from skin at chosen sites.
   - ◆ Gently rub skin surface at sites to remove dead skin cells.
   - ◆ Thoroughly cleanse the site with a mild soap and water solution. We do not recommend using ether or pure alcohol, because this dries the skin and increases the resistance.
   - ◆ Dry the skin completely before applying the electrodes.
2. Attach the clips or snaps to the electrodes before placing them.
3. Place the electrodes on the patient.
4. Attach the electrode cable to the patient cable and then plug the patient cable into the ECG connector on the MPM.

7.3.2 Choosing AHA or IEC Lead Placement

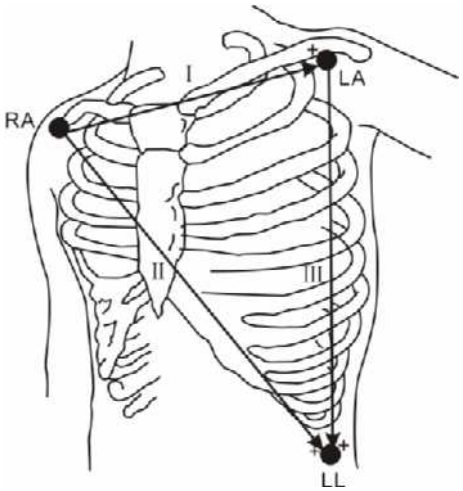
1. Select the ECG parameter window to enter the [**ECG Setup**] menu.
2. Select [**Lead Set**] and then select [**3-lead**], [**5-lead**] or [**12-lead**] according to the applied electrodes.
3. Select [**Main Menu**]→[**Maintenance** >>]→[**User Maintenance** >>]→enter the required password
4. Select [**Others** >>]→[**ECG Standard**] and then select [**AHA**] or [**IEC**] according to the standard that is applied for your hospital.

7.3.3 ECG Lead Placements

3-Leadwire Electrode Placement

Following is an electrode configuration when using 3 leadwires:

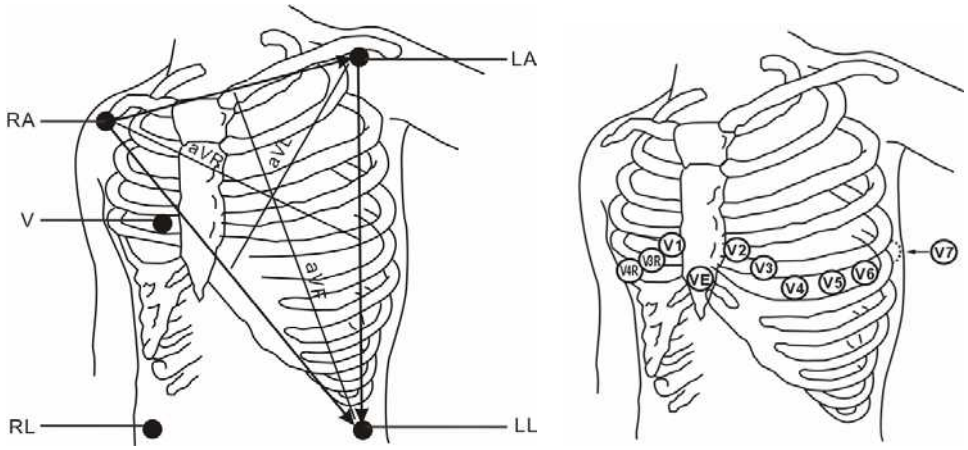
- RA placement: directly below the clavicle and near the right shoulder.
- LA placement: directly below the clavicle and near the left shoulder.
- LL placement: on the left lower abdomen.



5-Leadwire Electrode Placement

Following is an electrode configuration when using 5 leadwires:

- RA placement: directly below the clavicle and near the right shoulder.
- LA placement: directly below the clavicle and near the left shoulder.
- RL placement: on the right lower abdomen.
- LL placement: on the left lower abdomen.
- V placement: on the chest.

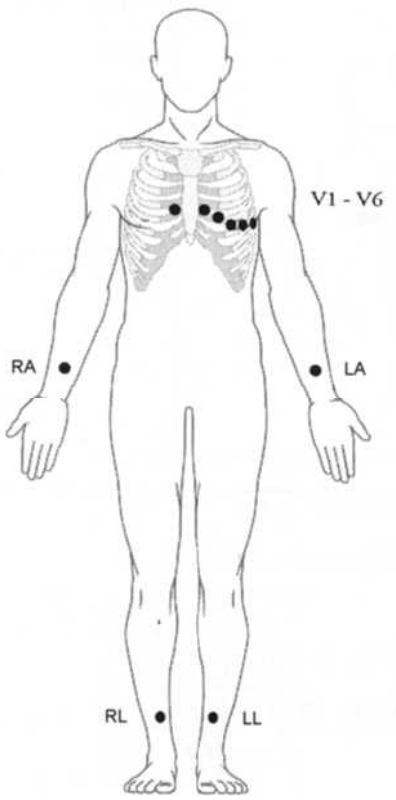


The chest (V) electrode can be placed on one of the following positions:

- V1 placement: on the fourth intercostal space at the right sternal border.
- V2 placement: on the fourth intercostal space at the left sternal border.
- V3 placement: midway between the V2 and V4 electrode positions.
- V4 placement: on the fifth intercostal space at the left midclavicular line.
- V5 placement: on the left anterior axillary line, horizontal with the V4 electrode position.
- V6 placement: on the left midaxillary line, horizontal with the V4 electrode position.
- V3R-V6R placement: on the right side of the chest in positions corresponding to those on the left.
- VE placement: over the xiphoid process.
- V7 placement: on posterior chest at the left posterior axillary line in the fifth intercostal space.
- V7R placement: on posterior chest at the right posterior axillary line in the fifth intercostal space.

12-Leadwire Electrode Placement

12-lead ECG uses 10 electrodes, which are placed on the patient's four limbs and chest. The limb electrodes should be placed on the soft skin and the chest electrodes placed according to the physician's preference.



Lead Placement for Surgical Patients

The surgical site should be taken into consideration when placing electrodes on a surgical patient. e.g. for open-chest surgery, the chest electrodes can be placed on the lateral chest or back. To reduce artifacts and interference from electrosurgical units, you can place the limb electrodes close to the shoulders and lower abdomen and the chest electrodes on the left side of the mid-chest. Do not place the electrodes on the upper arm. Otherwise, the ECG waveform will be very small.

⚠ WARNING

- **When using electrosurgical units (ESU), place ECG electrodes between the grounding plate of the ESU and the ESU to prevent unwanted burns. Never entangle the ESU cable and the ECG cable together.**
- **When using electrosurgical units (ESU), never place ECG electrodes near to the grounding plate of the ESU, as this can cause a lot of interference on the ECG signal.**

7.3.4 Checking Paced Status

It is important to set the paced status correctly when you start monitoring ECG. The paced symbol  is displayed when the [**Paced**] status is set to [**Yes**]. The pace pulse markers "|" are shown on the ECG wave when the patient has a paced signal.

To change the paced status, you can select either:

- the patient information area, or
- [**Main Menu**]→[**Patient Setup**]→[**Patient Demographics**], or,
- the ECG parameter window,

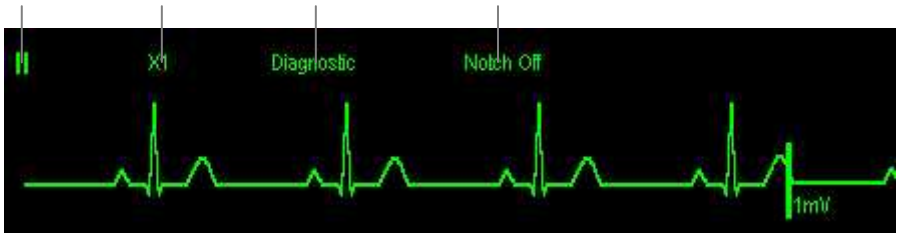
and then, select [**Paced**] from the popup menu and toggle between [**Yes**] and [**No**].

⚠Warning

- **For paced patients, you must set [Paced] to [Yes]. If it is incorrectly set to [No], the patient monitor could mistake a pace pulse for a QRS and fail to alarm when the ECG signal is too weak. Do not rely entirely on rate meter alarms when monitoring patients with pacemakers. Always keep these patients under close surveillance.**
- **For non-paced patients, you must set [Paced] to [No]. If it is incorrectly set to [Yes], the patient monitor may be unable to detect premature ventricular beats (including PVCs) and perform ST segment analysis.**

7.4 Understanding the ECG Display

Your display may be configured to look slightly different.



1. Lead label of the displayed wave
2. ECG gain
3. ECG filter label
4. Notch filter status

Besides, pace pulse marks "|" are not shown above the ECG wave if the [**Paced**] is set to [**Yes**] and the patient has a paced signal. If a defibrillator is connected, the synchronization marks (vertical lines) are shown on the ECG wave.

1. Current heart rate alarm limits
2. Current heart rate
3. Heart beat symbol

For 12-lead ECG display screen, refer to the section ***12-Lead ECG Monitoring***.

7.5 Changing ECG Settings

7.5.1 Accessing ECG Menus

By selecting the ECG parameter window, you can access the [**ECG Setup**] menu. By selecting any ECG wave, you can enter its lead menu.

7.5.2 Setting Pacemaker Rate (For Mortara only)

Some pacemaker pulses can be difficult to reject. When this happens, the pulses are counted as a QRS complex and could result in an incorrect HR and failure to detect some arrhythmias. You can set [**Pacemaker Rate**] to the pacemaker's rate in the [**ECG Setup**] menu. In this way, the patient monitor can calculate HR and detect arrhythmias more accurately. When [**Paced**] is set to [**No**], the pacemaker rate cannot be set.

7.5.3 Choosing the Alarm Source

In most cases the HR and PR numerics are identical. In order to avoid simultaneous alarms on HR and PR, the monitor uses either HR or PR as its active alarm source. To change the alarm source, select [**Alm Source**] in the [**ECG Setup**] menu and then select either:

- [**HR**]: if you want the HR to be the alarm source for HR/PR.
- [**PR**]: if you want the PR to be the alarm source for HR/PR.
- [**Auto**]: If the [**Alm Source**] is set to [**Auto**], the patient monitor will use the heart rate from the ECG measurements as the alarm source whenever a valid heart rate is available. If the heart rate becomes unavailable, for example the ECG module is turned off or becomes disconnected, the patient monitor will automatically switch to PR as the alarm source.

7.5.4 Choosing a 5-Lead ECG Display Screen

When monitoring with a 5-lead set, you can, in the [**ECG Setup**] menu, set the [**ECG Display**] screen to:

- [**Normal**]: The ECG waveform area shows 2 ECG waveforms.
- [**Full-Screen**]: The whole waveform area shows 7 ECG waveforms only.
- [**Half-Screen**]: The upper half part of the whole waveform area displays 7 ECG waveforms.

When [**ECG Display**] is set to [**Normal**] and [**Sweep Mode**] is set to [**Refresh**], cascaded ECG waveforms can be displayed. To cascade ECG waveforms:

1. Select either ECG wave to enter its lead menu.
2. Select [**Cascade**] and then select [**On**]. A cascaded waveform is displayed in two waveform positions.

7.5.5 Changing the ECG Filter Settings

The ECG filter setting defines how ECG waves are smoothed. Filter settings do not affect ST measurement. To change the filter setting, select [**Filter**] from [**ECG Setup**] and then select the appropriate setting.

- [**Monitor**]: Use under normal measurement conditions.
- [**Diagnostic**]: Use when diagnostic quality is required. The unfiltered ECG wave is displayed so that changes such as R-wave notching or discrete elevation or depression of the ST segment are visible.
- [**Surgery**]: Use when the signal is distorted by high frequency or low frequency interference. High frequency interference usually results in large amplitude spikes making the ECG signal look irregular. Low frequency interference usually leads to wandering or rough baseline. In the operating room, the surgery filter reduces artifacts and interference from electrosurgical units. Under normal measurement conditions, selecting [**Surgery**] may suppress the QRS complexes too much and then interfere with ECG analysis.

WARNING

- **The [Monitor] or [Surgery] filter may cause ECG waveform distortions and affect ST analysis, and the [Surgery] filter may affect arrhythmia analysis. Therefore, the [Diagnostic] filter is recommended when monitoring a patient in an environment with slight interference only.**

7.5.6 Switching the Notch Filter On or Off

The notch filter removes the line frequency interference. When [**Filter**] is not set to [**Diagnostic**], the notch filter always stays on. When [**Filter**] is set to [**Diagnostic**], you can switch the notch filter on or off as required.

1. Select the ECG parameter window to enter its setup menu.
2. Select [**Notch Filter**] and toggle between [**On**] and [**Off**]. Switching the notch filter on is recommended when there is interference (such as spikes) with the waveform.
3. When [**Notch Filter**] is set on, select [**Main Menu**]→[**Maintenance >>**]→[**User Maintenance >>**]→enter the required password.
4. Select [**Others >>**]→[**Notch Freq.**] and then select [**50Hz**] or [**60Hz**] according to the power line frequency.

7.5.7 Switching Defibrillator Synchronization On/Off

To switching defibrillator synchronization on or off:

1. Select the ECG parameter window to enter its setup menu.
2. Select [**Defib. Sync**] and toggle between [**On**] and [**Off**].

If a defibrillator is connected, a defibrillator synchronization pulse (100 ms, +5V) is outputted through the Defib. Sync Connector every time when the patient monitor detects an R-wave. When [**Dfib. Sync**] is set on, the message [**Defib Sync On**] is displayed in the technical alarm area.

⚠WARNING

- **Improper use of a defibrillator may cause injury to the patient. The user should determine whether to perform defibrillation or not according to the patient's condition.**
- **Before defibrillation, the user must ensure both defibrillator and monitor has passed the system test and can be safely used jointly.**
- **Before defibrillation, make sure that [Defib. Sync] is set to [On] and the [Filter] is set to [Diagnostic].**
- **After defibrillation is finished, set [Defib. Sync] to [Off] and select the filter mode as required.**

7.5.8 Changing ECG Wave Settings

To change a wave's settings, select the wave you want to change to enter its lead menu. In the lead menu:

- If the wave is too small or clipped, you can change its size by selecting an appropriate [**Gain**] setting. If you select [**Auto**] from [**Gain**], the patient monitor will automatically adjust the size of the ECG waves. In [**Normal**] screen, only the selected ECG wave's size is adjusted. In other screens, all ECG waves' size is adjusted simultaneously.
- You can change the wave sweep speed by selecting [**Sweep**] and then selecting the appropriate setting.
- You can adjust a wave's position by adjusting the ▲ or ▼ button beside [**Up-Down**] button.
- You can restore a wave to its original position by selecting [**Back to Default**].

7.5.9 Choosing the Heart Rate Source

For the Basic algorithm, to compute HR and to analyse and detect arrhythmia more accurately, you can choose a lead of best quality signals as the HR lead. To select a lead as the HR lead, in the [**Normal**] screen, select the wave corresponding to the HR parameter window to enter its lead menu. In the lead menu, select [**HR Source**] and then select the lead you want.

The selected lead should have the following characteristics:

- The QRS should be either completely above or below the baseline and it should not be biphasic.
- The QRS should be tall and narrow.
- The P-waves and T-waves should be less than 0.2mV.

For the Mortara algorithm, the system will analyze the ECG waveforms from multiple channels simultaneously so as to compute HR and to analyze and detect arrhythmia.

7.5.10 Adjusting QRS Volume

When HR is selected as the alarm source, QRS sounds are produced based on the HR. To adjust the QRS volume, select [**HR QRS Volume**] in the [**ECG Setup**] menu and select the appropriate setting. When valid SpO2 measured value is available, the system adjusts the pitch tone of QRS volume based on the SpO2 value.

7.6 About ST Monitoring

- ST segment analysis is only for use on adult patients. The default setting is off.
- ST segment analysis calculates ST segment elevations and depressions for individual leads and then displays them as numerics in the ST1 and ST2 areas.
- A positive value indicates ST segment elevation; a negative value indicates ST segment depression.
- Measurement unit of the ST segment: mV.
- Measurement range of the ST segment: -2.0 mV to +2.0 mV.

⚠ WARNING

- **This monitor provides ST level change information; the clinical significance of the information should be determined by a physician.**

7.6.1 Switching ST On and Off

To switch ST monitoring on or off:

1. In the [**ECG Setup**] menu, select [**ST Analysis** >>].
2. Select [**ST Analysis**] to toggle between [**On**] and [**Off**].

Reliable ST monitoring can hardly be ensured if:

- You are unable to get a lead that is not noisy.
- Arrhythmias such as atrial fib/flutter cause irregular baseline.
- The patient is continuously ventricularly paced.
- The patient has left bundle branch block.

In these cases, you may consider switching ST monitoring off.

7.6.2 Changing ST Filter Settings

When ST-segment analysis is performed, dedicated filters are used to ensure the diagnostic quality. When ST-segment analysis is switched on, [**Filter**] switches to [**Diagnostic**] automatically when it is not in the diagnostic mode. You can also select either [**Monitor**] or [**Surgery**]. However, ST-segment data will be severely distorted.

7.6.3 Understanding the ST Display

This example shows ST numerics with 5-lead ECG. Your monitor screen may look slightly different from the illustration.

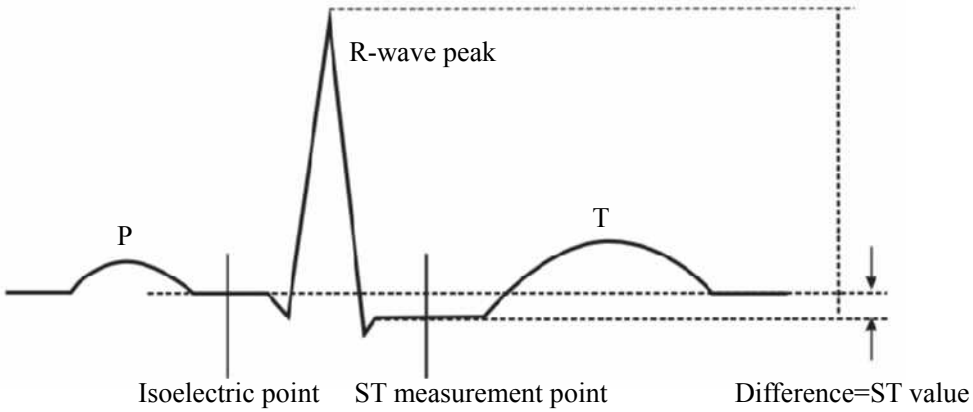
Select the ST parameter window and you can enter the [**ST Analysis**] menu.

7.6.4 Changing the ST Alarm Limits

High and low ST alarm limits can be set individually for each ECG lead. Alarm limits can also be set separately for single-lead and multi-lead ST monitoring. For 3-lead ECG monitoring, you can directly change the ST alarm limits in the [**ST Analysis**] menu. For 5- or 12-lead ECG monitoring, you can select [**Adjust ST Limits >>**] from [**ST Analysis**] and then set the ST alarm limits for each lead.

7.6.5 Adjusting ST Measurement Points

As shown in the figure below, the ST measured for each beat complex is the vertical difference between two measurement points with the R-wave peak as the baseline for the measurement.



The ISO and ST points need to be adjusted when you start monitoring and if the patient's heart rate or ECG morphology changes significantly. Exceptional QRS complexes are not considered for ST-segment analysis.

⚠ WARNING

- **Always make sure that the positions of ST measurement points are appropriate for your patient.**

■ For Basic algorithm

To adjust the ST measurement points:

1. In the [**ST Analysis**] menu, select [**Adjust ST Points >>**]. In the [**Adjust ST Points**] window, two vertical lines represent the ISO and ST point positions respectively.
2. Select the ◀ and ▶ arrow keys beside the [**ISO**] or [**ST**] to move the measurement points.
   - ◆ ISO-point (isoelectric): provides baseline for the measurement.
   - ◆ ST: marks the end point of the ST segment analysis.

■ For Mortara algorithm

To adjust the ST measurement points:

1. In the [**ST Analysis**] menu, select [**Adjust ST Points >>**]. In the [**Adjust ST Points**] window, three vertical lines represent the ISO, J and ST point positions respectively.
2. Select [**View Leads**] and use the Knob to select an ECG lead with obvious J point and R wave.
3. Select [**ISO**], [**J**] or [**ST**] and then use the Knob to adjust the position of each point.
   - ◆ The ISO-point (isoelectric) position is given relative to the R-wave peak. Position the ISO-point in the middle of the flattest part of the baseline (between the P and Q waves of in front of the P wave).
   - ◆ The J-point position is given relative to the R-wave peak and helps locating the ST-point. Position the J-point at the end of the QRS complex and the beginning of the ST segment.
   - ◆ The ST-point is positioned a fixed distance from the J-point. Move the J-point to position the ST-point at the midpoint of the ST segment. Position the ST-point relative to the J-point at either J+60 or J+80.

7.7 About Arrhythmia Monitoring

Arrhythmia analysis provides information about your patient's condition, including heart rate, PVC rate, rhythm and ectopics.

⚠ WARNING

- **Arrhythmia analysis program is intended to detect ventricular arrhythmias. It is not designed to detect atrial or supraventricular arrhythmias. It may incorrectly identify the presence or absence of an arrhythmia. Therefore, a physician must analyze the arrhythmia information with other clinical findings.**

7.7.1 Understanding the Arrhythmia Events

Basic algorithm

Arrhythmia message	Description
Asystole	No QRS complex for 4 consecutive seconds (in absence of ventricular fibrillation or chaotic signals).
Vfib/Vtac	A fibrillatory wave for 4 consecutive seconds. A dominant rhythm of adjacent Vs and a HR > the V-Tach Heart Rate Limit.
PNP	No pace pulse detected for 1.75 x average R-to-R intervals following a QRS complex (for paced patients only).
PNC	No QRS complex detected for 300 milliseconds following a pace pulse (for paced patients only).
PVC	One PVC detected in normal heartbeats.
Couplet	Paired PVCs detected in normal heartbeats.
VT > 2	More than 2 consecutive PVCs within the last minute.
Bigeminy	A dominant rhythm of N, V, N, V, N, V.
Trigeminy	A dominant rhythm of N, N, V,N, N, V, N, N, V.
R on T	R on T detected in normal heartbeats.
Missed Beats	No beat detected for 1.75 x average R-R interval for HR <120, or No beat for 1 second with HR >120 (for non-paced patients only), or No beat detected for more than the set pause threshold.
Brady	The average heart rate is less than 60 bpm.
Tachy	The average heart rate is greater than 60 bpm.

Mortara algorithm

Arrhythmia Message	Description
Asystole	No QRS complex detected within the set time threshold (in absence of ventricular fibrillation or chaotic signals).
Vfib	Ventricular fibrillation occurs and persists for 6 seconds.
Vtac	Ventricular HR is greater or equal to the preset threshold and the number of consecutive PVCs is greater than the preset threshold.
PNP	No pace pulse detected for (60*1000/pace rate +90) milliseconds following a QRS complex or a pacer pulse (for paced patients only).
PNC	No QRS complex detected for 300 milliseconds following a pace pulse (for paced patients only).
Multif. PVC	More than 2 PVCs of different forms occur in the predefined search window (3-31).
Couplet	Paired PVCs are detected.
VT > 2	Ventricular HR is greater than or equal to the preset threshold and the number of PVCs is greater than or equal to 3 but less than the preset threshold.
Vent. Rhythm	Ventricular HR is less than the preset threshold and the number of PVCs is greater than or equal to 3.
Bigeminy	A dominant rhythm of N, V,N, V, N, V.
Trigeminy	A dominant rhythm of N, N, V,N, N, V, N, N, V.
R on T	R on T is detected.
Irr. Rhythm	Consistently irregular rhythm
Missed Beats	No beat detected for 1.75x average R-R interval for HR <120, or No beat for 1 second with HR >120 (for non-paced patients only), or No beat detected for more than the set pause threshold.
Brady	The HR is less than the set bradycardia low limit.
Tachy	The HR is greater than the set tachycardia high limit.

7.7.2 Switching Arrhythmia Analysis On and Off

To switch arrhythmia analysis on or off:

1. In the [**ECG Setup**] menu, select [**Arrh. Analysis** >>].
2. Select [**Arrh. Analysis**] to toggle between [**On**] and [**Off**].

PVC numeric

When arrhythmia analysis is turned off, the PVC numeric will not be displayed.

7.7.3 Changing Arrhythmia Alarm Settings

To change arrhythmia alarm settings, select the ECG parameter area and then select [**Arrh. Analysis** >>]. In the [**Arrh. Analysis**] menu, you can:

- switch on or off the alarm for PVC by selecting [**PVCs**] option and then toggling between [**On**] and [**Off**].
- set the alarm level, alarm record, and alarm limit for PVC by selecting [**Alm Lev**], [**Alm Rec**] and [**PVCs High**] respectively.

To change the alarm settings for arrhythmia events, select [**Arrh. Alarm Setup** >>] from the [**Arrh. Analysis**]. The alarm on/off status and alarm level for asystole, ventricular fibrillation and ventricular tachycardia is unchangeable.

Be aware that when arrhythmia analysis is switched off:

- for Basic algorithm, no arrhythmia event will be detected.
- for Mortara algorithm, the HR-related alarms are still detected (the asystole, ventricular fibrillation and ventricular tachycardia alarm).

7.7.4 Changing Arrhythmia Threshold Settings

To change arrhythmia threshold settings, select the ECG parameter window→[**Arrh. Analysis >>**]→[**Arrh. Threshold Setup**]. In case an arrhythmia violates its threshold, an alarm will be triggered.

Arrh. event	Range	Default	Step	Unit
Asys. Delay	2 to 10	5	1	s
Vtac Rate	100 to 200	130	5	bpm
Vtac PVC	3 to 12	6	1	beats
Multif. PVC	3 to 31	15	1	beats
Tachy High	Adult: 100 to 300 Pediatric: 160 to 300 Neonate: 180 to 350	Adult: 100 Pediatric: 160 Neonate: 180	5	bpm
Brady Low	Adult: 15 to 60 Pediatric: 15 to 80 Neonate: 15 to 90	Adult: 60 Pediatric: 80 Neonate: 90	5	bpm

7.7.5 Initiating Arrhythmia Relearning Manually

During ECG monitoring, you may need to initiate an arrhythmia relearning when the patient's ECG template changes dramatically. A change in the ECG template could result in:

- incorrect arrhythmia alarms
- loss of ST measurement, and/or
- inaccurate heart rate

Arrhythmia relearning allows the monitor to learn the new ECG template so as to correct arrhythmia alarms and HR value, and restore ST measurements. To initiate relearning manually, select the ECG parameter window→[**Arrh. Analysis >>**]→[**Relearn Arrh.**]. When the patient monitor is learning, the message [**Arrh. Learning**] is displayed in the technical alarm area.

7.7.6 Automatic Arrhythmia Relearn

Arrhythmia relearning is initiated automatically whenever:

- The ECG lead or lead label is changed
- The ECG lead is re-connected
- A new patient is admitted
- After the calibration is completed, select [**Stop Calibrating ECG**]
- A switch happens between the options of [**ECG Screen**] during 5/12-lead ECG monitoring.

7.7.7 Reviewing Arrhythmia Events

To review previously happened arrhythmia events, in the [**ECG Setup**] menu, select [**Arrh. Analysis** >>]→[**Arrh. Review** >>].

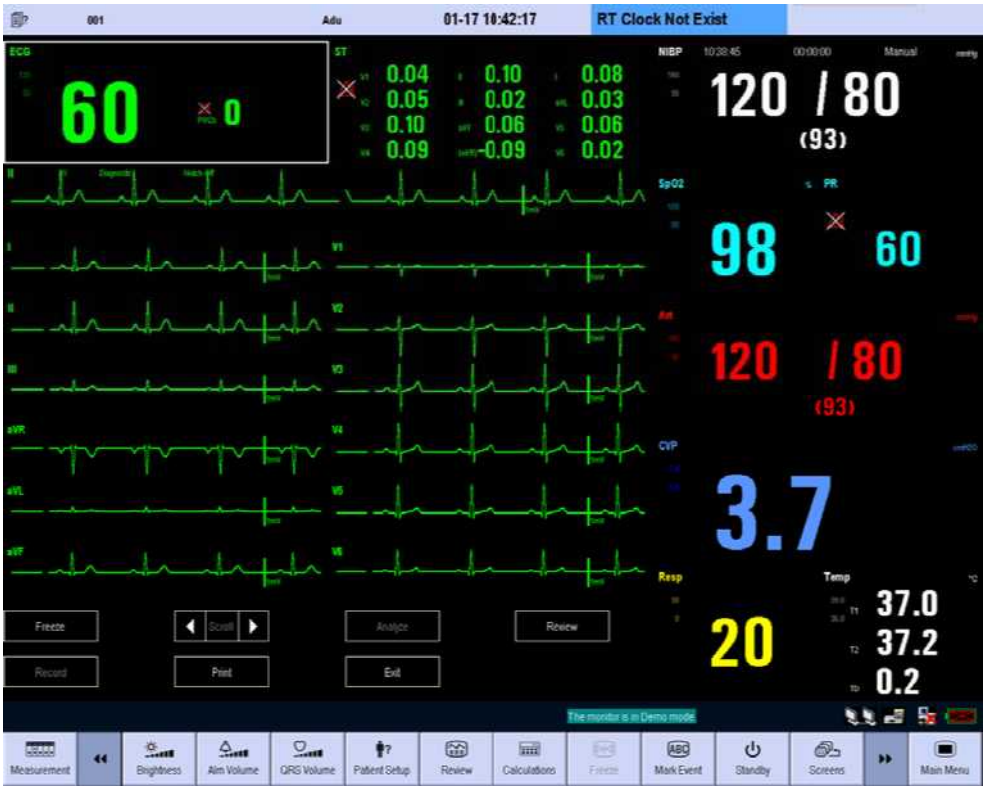
In the [**Arrh. Review**] window, you can:

- Select [**Index**] and then set a time as the index for finding your desired arrhythmia events.
- Rename an arrhythmia event by selecting the arrhythmia event you want to rename and then selecting [**Rename**] to enter a new name for it.
- Delete an arrhythmia event by selecting the one you want to delete and then selecting [**Delete Event**].
- Have more event selections by selecting  or  .
- Select  or  to navigate through the arrhythmia waveforms.
- Print out the currently displayed arrhythmia waveforms and numerics through the recorder by selecting [**Record**].
- Print out the currently displayed arrhythmia waveforms and numerics through the printer by selecting [**Print**].

7.8 12-Lead ECG Monitoring

7.8.1 Entering the 12-lead ECG Monitoring Screen

1. Refer to the section ***7.3.3 ECG Lead Placements*** for placing the electrodes.
2. In the [**ECG Setup**] menu, select [**Lead Set**]→[**12-Lead**], and select [**ECG Display**]→[**12-Lead**].



There are totally 12 ECG waves and 1 rhythm wave displayed on the screen. The rhythm lead is the HR-derived lead before entering the 12-lead ECG monitoring screen. The ST numerics are displayed in three groups:

- ST Ant (anterior): V1, V2, V3, V4
- ST Inf (inferior): II, III, aVF, (aVR)
- ST Lat (lateral): I, aVL, V5, V6

Although aVR is displayed in the ST Inf group, it is not an inferior lead.

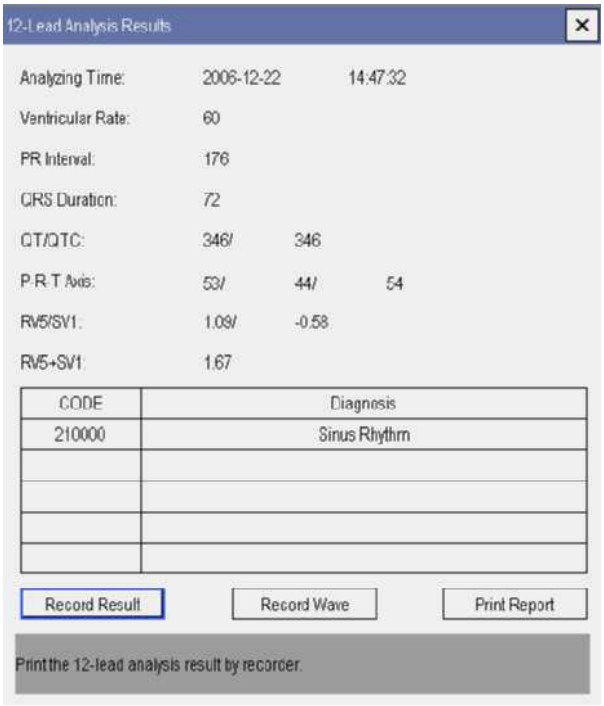
Additionally, the 12-lead ECG monitoring has the following features:

- The [**Filter**] mode is fixed to [**Diagnostic**] and cannot be changed.
- The on-screen QuickKey and the hardkey on the monitor's front are disabled.

7.8.2 12-Lead ECG Analysis

You can only start a 12-lead ECG analysis 11 seconds after entering the 12-lead ECG monitoring screen. Otherwise, the prompt message [**Not enough data. Cannot analyze.**] will be displayed. To start a 12-lead analysis, select [**Freeze**] and then [**Analyze**]. The following screen will be displayed. In this screen, you can:

- Select [**Record Result**] to print out the 12-lead ECG analysis results by the recorder.
- Select [**Record Wave**] to print out the 12-lead ECG analysis results and waves by the recorder.
- Select [**Print Report**] to print out the 12-lead ECG analysis report by the printer.

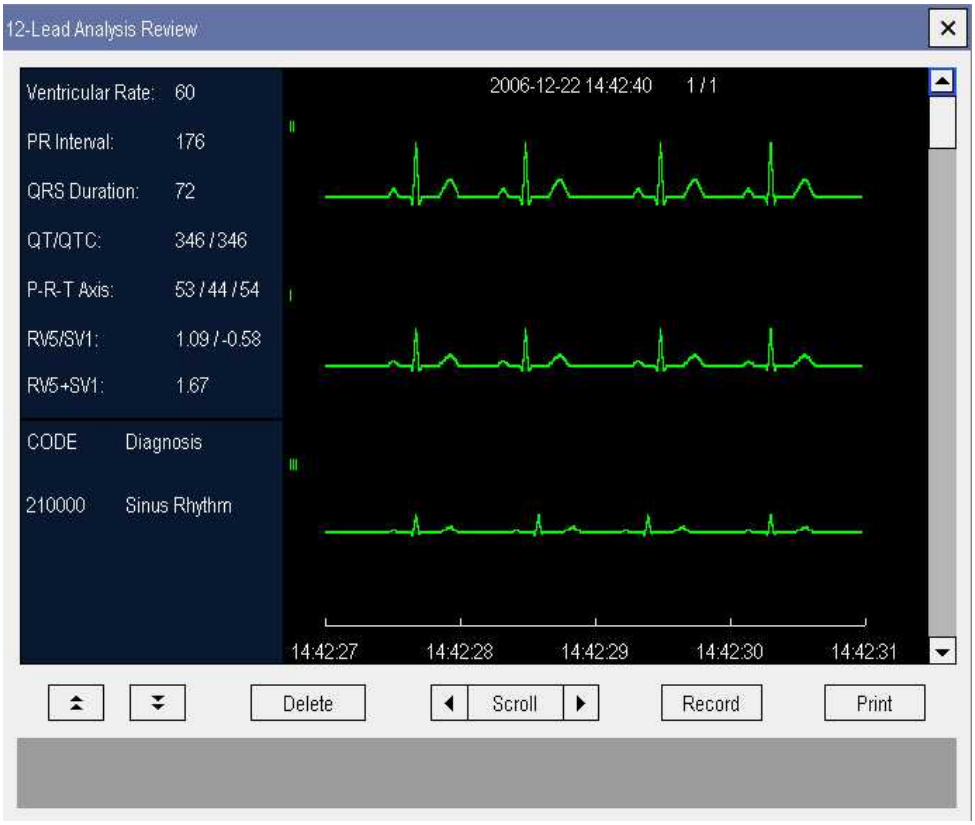


Besides, after selecting [**Freeze**], you can:

- Browse the frozen ECG waves by selecting [**Scroll**] and rotating the Knob, or selecting the ◀ or ▶ button beside [**Scroll**].
- Print out the currently frozen waves by selecting [**Record**].

7.8.3 Reviewing 12-Lead ECG Analysis Results

In the 12-lead ECG monitoring screen, you can review previous 12-lead ECG analyses by selecting [**Review**].



In this review window, you can:

- Select a set of 12-lead ECG analysis results for viewing. This window displays a set of 12-lead ECG analysis results only. You can view other sets of 12-lead ECG analysis results by selecting or beside the [**Delete**] button.
- Select or beside [**Scroll**] to navigate through the waveforms.
- Delete the currently displayed 12-lead ECG analysis results by selecting [**Delete**].
- Select [**Record**] to print out the currently displayed 12-lead ECG analysis results by the recorder.
- Select [**Print**] to print out the currently displayed 12-lead ECG analysis results by the printer.

FOR YOUR NOTES

8 Monitoring Respiration (Resp)

8.1 Introduction

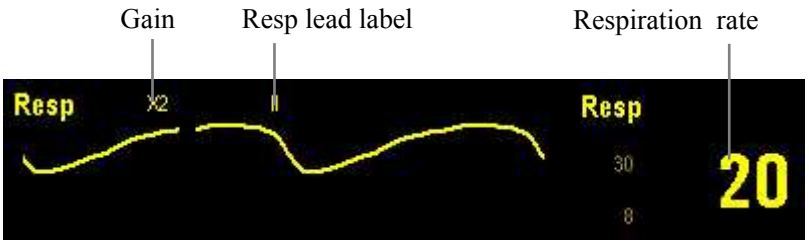
Impedance respiration is measured across the thorax. When the patient is breathing or ventilated, the volume of air changes in the lungs, resulting in impedance changes between the electrodes. Respiration rate (RR) is calculated from these impedance changes, and a respiration waveform appears on the patient monitor screen.

8.2 Safety Information

⚠Warning

- **When monitoring the patient's respiration, do not use ESU-proof ECG cables.**
- **If you do not set the detection level for the respiration correctly in manual detection mode, it may not be possible for the monitor to detect apnea. If you set the detection level too low, the monitor is more likely to detect cardiac activity, and to falsely interpret cardiac activity as respiratory activity in the case of apnea.**
- **The respiration measurement does not recognize the cause of apneas. It only indicates an alarm if no breath is detected when a pre-adjusted time has elapsed since the last detected breath. Therefore, it cannot be used for diagnostic purpose.**

8.3 Understanding the Resp Display



By selecting the waveform area, you can enter the [**Resp Waveform**] menu. By selecting the Resp parameter window, you can enter the [**Resp Setup**] menu.

NOTE

- **Respiration monitoring is not for use on the patients who are very active, as this will cause false alarms.**

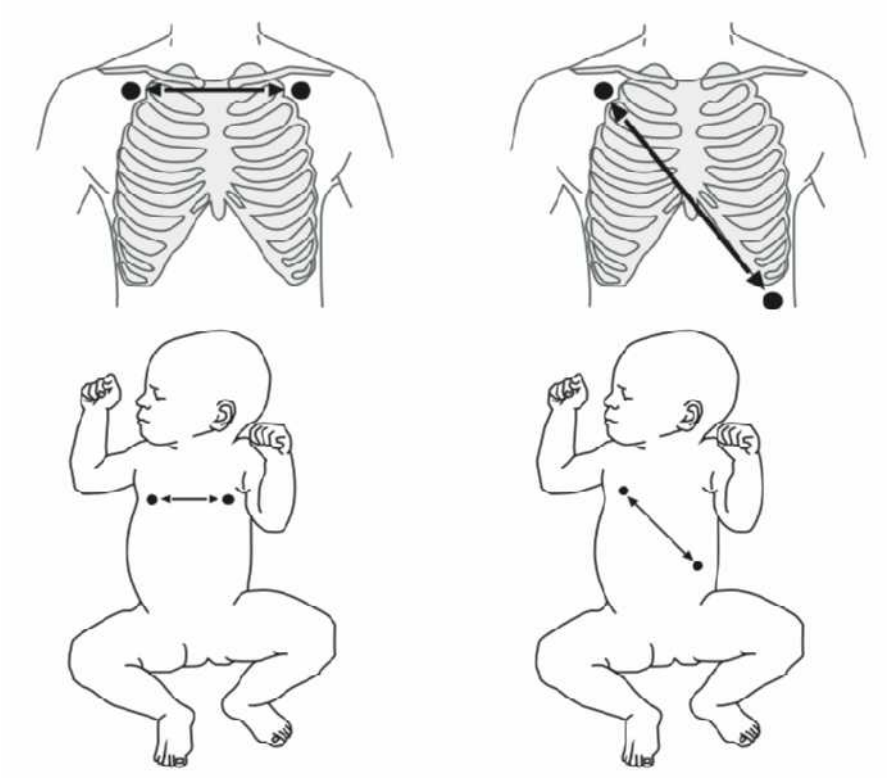
8.4 Placing Resp Electrodes

As the skin is a poor conductor of electricity, preparing the skin is necessary for a good Respiration signal. You can refer to the ECG section for how to prepare the skin.

As the Respiration measurement adopts the standard ECG electrode placement, you can use different ECG cables (3-lead, 5-lead or 12-lead). Since the respiration signal is measured between two ECG electrodes, if a standard ECG electrode placement is applied, the two electrodes should be RA and LA of ECG Lead I, or RA and LL of ECG Lead II.

NOTE

- **To optimize the respiration waveform, place the RA and LA electrodes horizontally when monitoring respiration with ECG Lead I; place the RA and LL electrodes diagonally when monitoring respiration with ECG Lead II.**



Lead I Lead II

8.4.1 Optimizing Lead Placement for Resp

If you want to measure Resp and you are already measuring ECG, you may need to optimize the placement of the two electrodes between which Resp will be measured. Repositioning ECG electrodes from standard positions results in changes in the ECG waveform and may influence ST and arrhythmia interpretation.

8.4.2 Cardiac Overlay

Cardiac activity that affects the Resp waveform is called cardiac overlay. It happens when the Resp electrodes pick up impedance changes caused by the rhythmic blood flow. Correct electrodes placement can help to reduce cardiac overlay: avoid the liver area and the ventricles of the heart in the line between the respiratory electrodes. This is particularly important for neonates.

8.4.3 Abdominal Breathing

Some patients with restricted movement breathe mainly abdominally. In these cases, you may need to place the left leg electrode on the left abdomen at the point of maximum abdominal expansion to optimise the respiratory wave.

8.4.4 Lateral Chest Expansion

In clinical applications, some patients (especially neonates) expand their chests laterally, causing a negative intrathoracic pressure. In these cases, it is better to place the two respiration electrodes in the right midaxillary and the left lateral chest areas at the patient's maximum point of the breathing movement to optimise the respiratory waveform.

8.5 Choosing the Respiration Lead

In the [**Resp Waveform**] menu, select [**Lead**] and toggle between [**I**] and [**II**].

8.6 Changing the Apnea Alarm Delay

The apnea alarm is a high-level alarm used to detect apneas. You can set the apnea alarm delay time after which the patient monitor alarms if the patient stops breathing. In the [**Resp Setup**] menu, select [**Apnea Time**] and then select the appropriate setting.

8.7 Changing Resp Detection Mode

In either [**Resp Setup**] or [**Resp Waveform**] menu, select [**Detection Mode**] and toggle between [**Auto**] and [**Manual**].

- In auto detection mode, the patient monitor adjusts the detection level automatically, depending on the wave height and the presence of cardiac artifact. Note that in auto detection mode, the detection level (a dotted line) is not displayed on the waveform.

  Use auto detection mode for situations where:

  - The respiration rate is not close to the heart rate.
  - Breathing is spontaneous, with or without continuous positive airway pressure (CPAP).
  - Patients are ventilated, except patients with intermittent mandatory ventilation (IMV).

- In manual detection mode, you adjust the dotted detection level line to the desired level by selecting [**Upper Line**] or [**Lower Line**] and then selecting  or  beside them. Once set, the detection level will not adapt automatically to different respiration depths. It is important to remember that if the depth of breathing changes, you may need to change the detection level.

  Use manual detection mode for situations where:

  - The respiration rate and the heart rate are close.
  - Patients have intermittent mandatory ventilation.
  - Respiration is weak. Try repositioning the electrodes to improve the signal.

In Auto Detection Mode, if you are monitoring Resp and ECG is switched off, the monitor cannot compare the ECG and Resp rates to detect cardiac overlay. The respiration detection level is automatically set higher to prevent the detection of cardiac overlay as respiration.

In Manual Detection Mode, cardiac overlay can in certain situations trigger the respiration counter. This may lead to a false indication of a high respiration or an undetected apnea condition. If you suspect that cardiac overlay is being registered as breathing activity, raise the detection level above the zone of cardiac overlay. If the Resp wave is so small that raising the detection level is not possible, you may need to optimize the electrode placement as described in the section "Lateral Chest Expansion".

8.8 Changing Resp Wave Settings

⚠WARNING

- **When monitoring in manual detection mode, make sure to check the respiration detection level after you have increased or decreased the size of the respiration wave.**

In the [**Resp Waveform**] menu, you can:

- Select [**Gain**] and then select an appropriate setting. The bigger the gain is, the larger the wave amplitude is.
- Select [**Sweep**] and then select an appropriate setting. The faster the wave sweeps, the wider the wave is.

FOR YOUR NOTES

9 Monitoring PR

9.1 Introduction

The pulse numeric counts the arterial pulsations that result from the mechanical activity of the heart. You can display a pulse from any measured SpO_2 or any arterial pressure (see the IBP section). The displayed pulse numeric is color-coded to match its source.

1. PR Source
2. PR: detected beats per minute.

9.2 Entering the PR Setup

You can enter the [**PR Setup**] menu by the following means:

- If a pulse numeric is displayed on the screen, select it to enter the [**PR Setup**] menu.
- If no pulse numeric is visible, in the [**SPO2 Setup**] menu, select [**PR Setup** >>], or
- Select an arterial pressure to enter its setup menu and then select [**PR Setup** >>].

9.3 Setting the PR Source

The current pulse source is displayed in the PR parameter area. The pulse rate chosen as pulse source :

- is monitored as system pulse and generates alarms when you select PR as the active alarm source ;
- is stored in the monitor's database and reviewed in the graphic/tabular trends ; in trend graphs, as the PR curve is in the same color with the PR source , it is unlikely to distinguish the PR source ;
- is sent via the network to the central monitoring system, if available.

To set which pulse rate as PR source :

1. Enter the [**PR Setup]** menu.
2. Select [**PR Source**] and then select a label or [**Auto**] from the popup menu.

The popup menu displays the currently available PR sources from top to bottom by priority. When you select [**Auto**], the system will automatically select the first option as the PR source from the popup menu. When the current PR source is switched off, the system will automatically switch [**PR Source**] to [**Auto**]. When you select [**IBP**], the system will automatically select the first pressure label as the PR source from the popup menu.

9.4 Switching PR Measurement On/Off

To switch PR measurement on, enter the [**PR Setup**] menu and select [**PR On**]. To switch PR measurement off, select [**PR Off**] from [**PR Setup**] and then select [**Ok**] from popup dialog box.

9.5 Selecting the Active Alarm Source

In most cases the HR and pulse numerics are identical. In order to avoid simultaneous alarms on HR and Pulse, the monitor uses either HR or Pulse as its active alarm source. To change the alarm source, select [**Alm Source**] in the [**ECG Setup**] or [**PR Setup**] menu and then select either:

- [**HR**]: The monitor will use the HR as the alarm source for HR/pulse.
- [**PR**]: The monitor will use the PR as the alarm source for HR/pulse.
- [**Auto**]: If the [**Alm Source**] is set to [**Auto**], the monitor will use the heart rate from the ECG measurement as the alarm source whenever the ECG measurement is switched on and a valid heart rate is available. If the heart rate becomes unavailable, for example if leads becomes disconnected, and a pulse source is switch on and available, the monitor will automatically switch to Pulse as the alarm source., using the pulse rate from the measurement currently selected as system pulse. When the Leads Off condition is corrected, the monitor will automatically switch to the heart rate as the alarm source.

9.6 QRS Tone

When PR is used as the alarm source, the PR source will be used as a source for the QRS tone. You can change the QRS volume by adjusting [**Beat Vol**] in the [**PR Setup**] menu. When a valid SpO_2 value exists, the system will adjust the pitch tone of QRS volume according to the SpO_2 value.

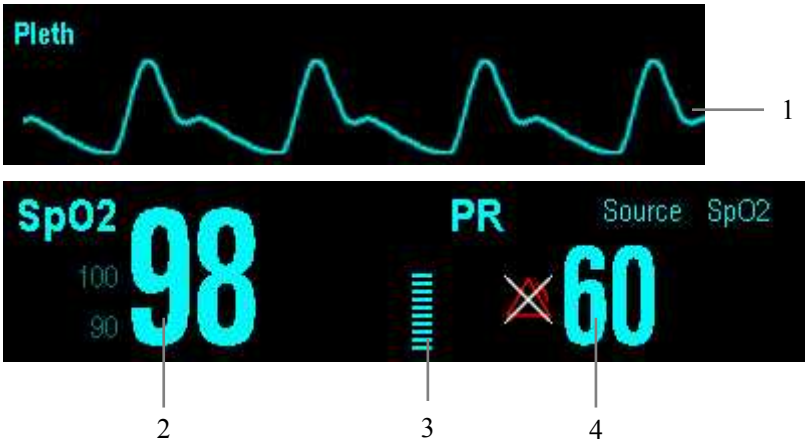
FOR YOUR NOTES

10 Monitoring SpO_2

10.1 Introduction

SpO_2 monitoring is a non-invasive technique used to measure the amount of oxygenated haemoglobin and pulse rate by measuring the absorption of selected wavelengths of light. The light generated in the probe passes through the tissue and is converted into electrical signals by the photodetector in the probe. The SpO_2 module processes the electrical signal and displays a waveform and digital values for SpO_2 and pulse rate.

This device is calibrated to display functional oxygen saturation. It provides four measurements:



1. Pleth waveform (Pleth): visual indication of patient's pulse. The waveform is normalized.
2. Oxygen saturation of arterial blood (SpO_2): percentage of oxygenated hemoglobin in relation to the sum of oxyhemoglobin and deoxyhemoglobin.
3. Perfusion indicator: the pulsatile portion of the measured signal caused by arterial pulsation.
4. Pulse rate (derived from pleth wave): detected pulsations per minute.

10.2 Safety

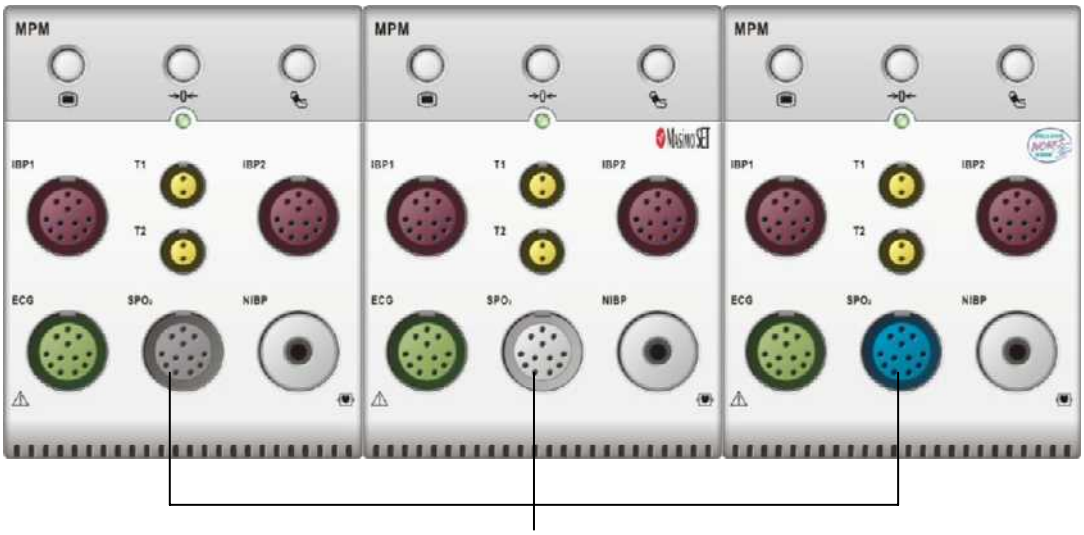
⚠ WARNING

- **Use only SpO_2 sensors specified in this manual. Follow the SpO_2 sensor's instructions for use and adhere to all warnings and cautions.**
- **When a trend toward patient deoxygenation is indicated, blood samples should be analyzed by a laboratory co-oximeter to completely understand the patient's condition.**
- **Do not use SpO_2 sensors during magnetic resonance imaging (MRI). Induced current could potentially cause burns. The sensor may affect the MRI image, and the MRI unit may affect the accuracy of the oximetry measurements.**
- **Prolonged continuous monitoring may increase the risk of undesirable changes in skin characteristics, such as irritation, reddening, blistering or burns. Inspect the sensor site every two hours and move the sensor if the skin quality changes. For neonates, or patients with poor peripheral blood circulation or sensitive skin, inspect the sensor site more frequently.**

10.3 Identifying SpO_2 Modules

To identify which SpO_2 module is incorporated into your MPM, see the company logo located at the right upper corner as shown below:

- MPM SpO_2 module: no logo.
- Masimo SpO_2 module: Masimo SET.
- Nellcor SpO_2 module: Nellcor.



10.4 Applying the Sensor

1. Select an appropriate sensor according to the module type, patient category and weight.
2. Remove colored nail polish from the application site.
3. Apply the sensor to the patient.
4. Select an appropriate adapter cable according to the connector type and plug this cable into the MPM.
5. Connect the sensor cable to the adapter cable.

10.5 Changing SpO_2 Settings

10.5.1 Accessing SpO_2 Menus

- By selecting the SpO_2 parameter window, you can access the [**SpO2 Setup**] menu.
- By selecting the PR numeric, you can access the [**PR Setup**] menu.
- By selecting the Pleth wave, you can access the [**Pleth Waveform**] menu.

10.5.2 Adjusting the Desat Alarm Limit

The desat alarm is a high level alarm notifying you of potentially life threatening drops in oxygen saturation. To adjust the desat alarm limit, select [**Desat Limit]** in the [**SpO2 Setup**] menu and then adjust the limit. When the SpO_2 value is below the desat alarm limit, the message [**SpO2 Desat]** is displayed. In this case, the monitor will not alarm if other physiological alarms occur.

10.5.3 Setting SpO_2 Sensitivity

For Masimo SpO_2 module, you can set [**Sensitivity**] to [**Normal**] or [**Maximum**] in the [**SpO_2 Setup**] menu. When the [**Sensitivity**] is set to [**Maximum**], the patient monitor is more sensitive to minor signals. When monitoring critically ill patients whose pulsations are very weak, it is strongly recommended that the sensitivity is set to [**Maximum**]. When the patient tends to be in motion, noise or invalid signals may be caused. In this case, it is recommended that the sensitivity is set to [**Normal**] so that the interference caused by motion can be filtered and therefore the measurement stability can be ensured.

10.5.4 Changing Averaging Time

The SpO_2 value displayed on the monitor screen is the average of data collected within a specific time. The shorter the averaging time is, the quicker the patient monitor responds to changes in the patient's oxygen saturation level. Contrarily, the longer the averaging time is, the slower the patient monitor responds to changes in the patient's oxygen saturation level, but the measurement accuracy will be improved. For critically ill patients, selecting shorter averaging time will help understanding the patient's state.

To set the averaging time:

- For MPM SpO_2 module, select [**Sensitivity**] in the [**SpO2 Setup**] menu and then toggle between [**High**], [**Med**] and [**Low**], which respectively correspond to 7 s, 9 s and 11 s.
- For Masimo SpO_2 module, select [**Averaging**] in the [**SpO2 Setup**] menu and then toggle between [**2-4 s**], [**4-6 s**], [**8 s**], [**10 s**], [**12 s**], [**14 s**] and [**16 s**].
- For Nellcor SpO_2 module, select [**Averaging**] in the [**SpO2 Setup**] menu and then toggle between [**8 s**] and [**16 s**].

10.5.5 Monitoring SpO_2 and NIBP Simultaneously

When monitoring SpO_2 and NIBP on the same limb simultaneously, you can switch [**NIBP Simul**] on in the [**SpO2 Setup**] menu to lock the SpO_2 alarm status until the NIBP measurement ends. If you switch [**NIBP Simul**] off, low perfusion caused by NIBP measurement may lead to inaccurate SpO_2 readings and therefore cause false physiological alarms.

10.5.6 Sat-Seconds Alarm Management

The Sat-Seconds feature is available with the Nellcor SpO_2 module to decrease the likelihood of false alarms caused by motion artifacts. To set the Sat-Seconds limit, select [**Sat-Seconds**] in the [**SpO2 Setup**] menu and then select the appropriate setting.

With traditional alarm management, high and low alarm limits are set for monitoring oxygen saturation. During monitoring, as soon as an alarm limit is violated, an audible alarm immediately sounds. When the patient % SpO_2 fluctuates near an alarm limit, the alarm sounds each time the limit is violated. Such frequent alarm can be distracting. Nellcor's Sat-Seconds alarm management technique is used to reduce these nuisance alarms.

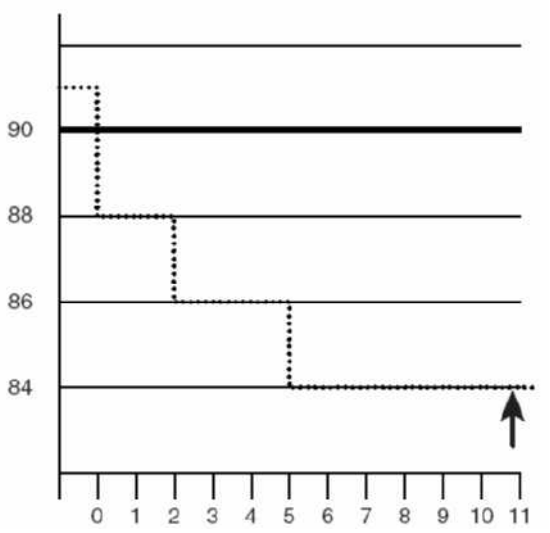
With Sat-Seconds alarm management, high and low alarm limits are set in the same way as traditional alarm management. A Sat-Seconds limit is also set. The Sat-Seconds limit controls the amount of time that SpO_2 saturation may be outside the set limits before an alarm sounds. The method of calculation is as follows: the number of percentage points that the SpO_2 saturation falls outside the alarm limit is multiplied by the number of seconds that it remains outside the limit. This can be stated as the equation:

Sat-Seconds= Points × Seconds

Only when the Sat-Seconds limit is reached, the monitor gives a Sat-Seconds alarm. For example, the figure below demonstrates the alarm response time with a Sat-Seconds limit set at 50 and a low SpO_2 limit set at 90%. In this example, the patient % SpO_2 drops to 88% (2 points) and remains there for 2 seconds. Then it drops to 86% (4 points) for 3 seconds, and then to 84% (6 points) for 6 seconds. The resulting Sat-Seconds are:

% SpO2	Seconds	Sat-Seconds
2×	2=	4
4×	3=	12
6×	6=	36
Total Sat-Seconds=		52

After approximately 10.9 seconds, a Sat-Second alarm would sound, because the limit of 50 Sat-Seconds would have been exceeded.



Saturation levels may fluctuate rather than remaining steady for a period of several seconds. Often, the patient % SpO_2 may fluctuate above and below an alarm limit, re-entering the non-alarm range several times. During such fluctuation, the monitor integrates the number of %SpO_2 points, both positive and negative, until either the Sat-Seconds limit is reached, or the patient%SpO_2 re-enters the non-alarm range and remains there.

10.5.7 Changing the Speed of the Pleth Wave

In the [**Pleth Waveform**] menu, select [**Sweep**] and then select the appropriate setting. The faster the waveform sweeps, the wider the waveform is.

10.6 Measurement Limitations

If you doubt the measured SpO2, check patient vital signs first. Then check the patient monitor and SpO2 sensor. The following factors may influence the accuracy of measurement:

- Ambient light
- Physical movement (patient and imposed motion)
- Diagnostic testing
- Low perfusion
- Electromagnetic interference, such as MRI environment
- Electrosurgical units
- Dysfunctional haemoglobin, such as carboxyhemoglobin (COHb)and methemoglobin (MetHb)
- Presence of certain dyes, such as methylene and indigo carmine
- Inappropriate positioning of the SpO2 sensor, or use of incorrect SpO2
- Drop of arterial blood flow to immeaurable level caused by shock, anemia, low temperature or vasoconstrictor.

10.7 Masimo Information

- Masimo Patents

This device is covered under one or more the following U.S. Patents: 5,482,036; 5,490,505; 5,632,272; 5,685,299; 5,758,644; 5,769,785; 6,002,952; 6,036,642; 6,067,462; 6,206,830; 6,157,850 and international equivalents. U.S.A international patents pending.

- No Implied License

Possession or purchase of this device does not convey any express or implied license to use the device with unauthorized replacement parts which would, alone, or in combination with this device, fall within the scope of one or more of the patents relating to this device.

10.8 Nellcor Information

- Nellcor Patents

This device is covered under one or more the following U.S. Patents: 4,802,486; 4,869,254; 4,928,692; 4,934,372; 5,078,136; 5,351,685; 5,485,847; 5,533,507; 5,577,500; 5,803,910; 5,853,364; 5,865,736; 6,083,172; 6,463,310; 6,591,123; 6,708,049; Re.35,122 and international equivalents. U.S.A international patents pending.

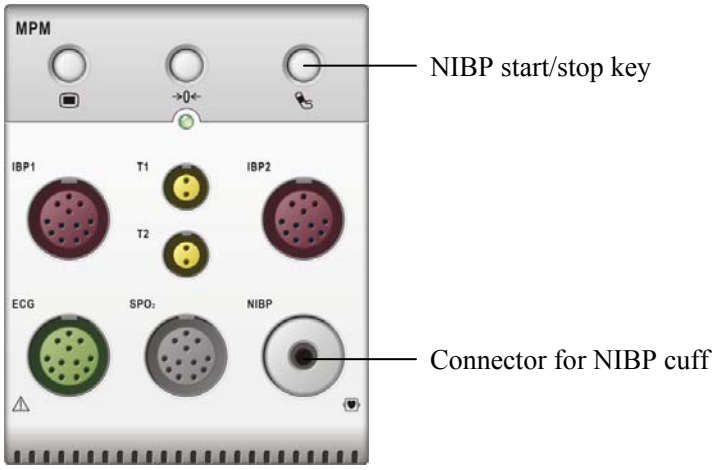
- No Implied License

Possession or purchase of this device does not convey any express or implied license to use the device with unauthorized replacement parts which would, alone, or in combination with this device, fall within the scope of one or more of the patents relating to this device.

11 Monitoring NIBP

11.1 Introduction

The MPM uses the oscillometric method for measuring the non-invasive blood pressure (NIBP). This measurement can be used for adults, pediatrics and neonates.



Automatic non-invasive blood pressure monitoring uses the oscillometric method of measurement. To understand how this method works, we'll compare it to the auscultative method. With auscultation, the clinician listens to the blood pressure and determines the systolic and diastolic pressures. The mean pressure can then be calculated with reference to these pressures as long as the arterial pressure curve is normal.

Since the monitor cannot hear the blood pressure, it measures cuff pressure oscillation amplitudes. Oscillations are caused by blood pressure pulses against the cuff. The oscillation with the greatest amplitude is the mean pressure. This is the most accurate parameter measured by the oscillometric method. Once the mean pressure is determined, the systolic and diastolic pressures are calculated with reference to the mean.

Simply stated, auscultation measures systolic and diastolic pressures and the mean pressure is calculated. The oscillometric method measures the mean pressure and determines the systolic and diastolic pressures.

As specified by IEC 60601-2-30/EN60601-2-30, NIBP measurement can be performed during electro-surgery and discharge of defibrillator.

NIBP diagnostic significance must be decided by the doctor who performs the measurement..

NOTE

- **Blood pressure measurements determined with this device are equivalent to those obtained by a trained observer using the cuff/stethoscope auscultatory method or an intra-arterial blood pressure measurement device, within the limits prescribed by the American National Standard, Manual, electronic, or automated sphygmomanometers.**

11.2 Safety

⚠ WARNING

- **Be sure to select the correct patient category setting for your patient before measurement. Do not apply the higher adult settings for pediatric or neonatal patients. Otherwise it may present a safety hazard.**
- **Do not measure NIBP on patients with sickle-cell disease or any condition where skin damage has occurred or is expected.**
- **Use clinical judgement to determine whether to perform frequent unattended blood pressure measurements on patients with severe blood clotting disorders because of the risk of hematoma in the limb fitted with the cuff.**
- **Do not use the NIBP cuff on a limb with an intravenous infusion or arterial catheter in place. This could cause tissue damage around the catheter when the infusion is slowed or blocked during cuff inflation.**
- **If you doubt the NIBP readings, determines the patient's vital signs by alternative means and then verify that the monitor is working correctly.**

11.3 Measurement Limitations

Measurements are impossible with heart rate extremes of less than 40bpm or greater than 240bpm, or if the patient is on a heart-lung machine.

The measurement may be inaccurate or impossible:

- If a regular arterial pressure pulse is hard to detect
- With excessive and continuous patient movement such as shivering or convulsions
- With cardiac arrhythmias

- Rapid blood pressure changes
- Severe shock or hypothermia that reduces blood flow to the peripheries
- Obesity, where a thick layer of fat surrounding a limb dampens the oscillations coming from the artery

11.4 Measurement Methods

There are three methods of measuring NIBP:

- Manual: measurement on demand.
- Auto: continually repeated measurements at set intervals.
- STAT: continually rapid series of measurements over a five minute period, then return to the previous mode.

11.5 Setting Up the NIBP Measurement

11.5.1 Preparing to Measure NIBP

1. Power on the monitor.
2. Verify that the patient category is correct. Change it if necessary.
3. Plug the air tubing into the NIBP connector on the MPM module.
4. Select a correct sized cuff and then apply it as follows:
   - Determine the patient's limb circumference.
   - Select an appropriate cuff by referring to the limb circumference marked on the cuff. The width of the cuff should be 40% (50% for neonates) of the limb circumference, or 2/3 of the upper arm's length. The inflatable part of the cuff should be long enough to encircle at least 50% to 80% of the limb.
   - Apply the cuff to an upper arm or leg of the patient and make sure the Φ marking on the cuff matches the artery location. Do not wrap the cuff too tightly around the limb. It may cause discoloration, and ischemia of the extremities. Make sure that the cuff edge falls within the marked range. If it does not, use a larger or smaller cuff that will fit better.
5. Connect the cuff to the air tubing and make sure that the bladder inside the cover is not folded and twisted.

NOTE

- **The use of the equipment is restricted to one patient at a time;**

11.5.2 Starting and Stopping Measurements

You can start and stop measurements by using the hardkey on either the monitor's front panel or the MPM module, or the on-screen QuickKey.

11.5.3 Correcting the Measurement if Limb is not at Heart Level

The cuffed limb should be at the same level as the patient's heart. If the limb is not at the heart level, to the displayed value:

- Add 0.75 mmHg (0.10 kPa) for each centimetre higher, or
- Deduct 0.75 mmHg (0.10 kPa) for each centimeter lower.

11.5.4 Enabling NIBP Auto Cycling and Setting the Interval

1. Select the NIBP parameter window to enter the [**NIBP Setup**] menu.
2. Select [**Interval**] and then select a desired time interval. Selecting [**Manual**] switches to manual mode.
3. Start a measurement manually. Then monitor will then automatically repeat NIBP measurements at the set time interval.

⚠WARNING

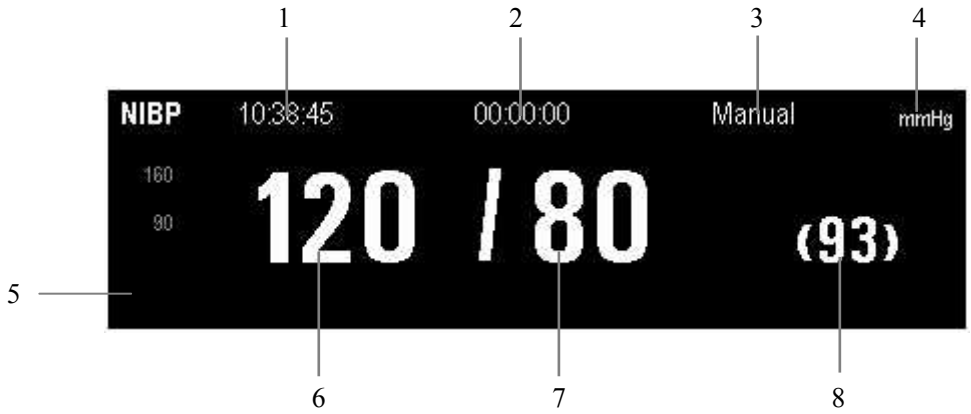
- **Continuous non-invasive blood pressure measurements may cause purpura, ischemia and neuropathy in the limb with the cuff. Inspect the application site regularly to ensure skin quality and inspect the extremity of the cuffed limb for normal color, warmth and sensitivity. If any abnormity occurs, move the cuff to another site or stop the blood pressure measurements immediately.**

11.5.5 Starting a STAT Measurement

1. Select the NIBP parameter window to enter the [**NIBP Setup**] menu.
2. Select [**NIBP STAT**]. The STAT mode initiates 5 minutes of continuous, sequential, automatic NIBP measurements.

11.6 Understanding the NIBP Numerics

The NIBP display shows numerics only as below. Your display may be configured to look slightly different.



1. Time of last measurement
2. Time remaining to next measurement
3. Measurement mode
4. Unit of pressure: mmHg or kPa
5. Prompt message area: shows NIBP-related prompt messages
6. Systolic pressure
7. Diastolic pressure
8. Mean pressure obtained after the measurement and cuff pressure obtained during the measurement

11.7 Changing NIBP Settings

By selecting the NIBP parameter window, you can enter the [**NIBP Setup**] menu.

11.7.1 Choosing NIBP Alarm Source

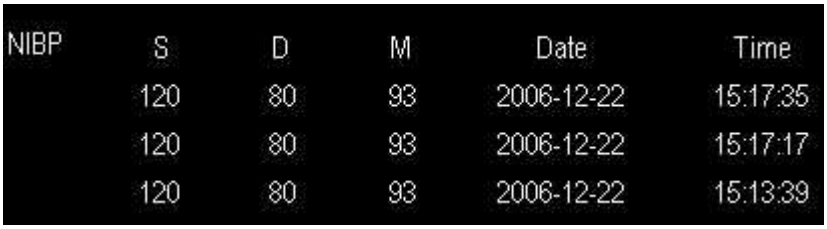
You can monitor for alarm conditions in systolic, diastolic and mean pressure, either singly or parallel. In the [**NIBP Setup**], select [**Alm Source**] and choose from:

- [**Sys]**: alarms are given only when the systolic pressure violates the alarm limits.
- [**Dia**]: alarms are given only when the diastolic pressure violates the alarm limits.
- [**Mean**]: alarms are given only when the mean pressure violates the alarm limits.
- [**Sys&Mean**]: alarms are given when the systolic or mean pressure violates the alarm limits.
- [**Mean&Dia**]: alarms are given when the mean or diastolic pressure violates the alarm limits.
- [**Sys&Dia**]: alarms are given when the systolic or diastolic pressure violates the alarm limits.
- [**All**]: alarms are given when the systolic or mean or diastolic pressure violates the alarm limits.

11.7.2 Displaying NIBP Measurements

You can display one set or multiple sets of NIBP measurements simultaneously. In the [**NIBP Setup**] menu, select [**Display NIBP**] and toggle between [**Single-Group**] and [**Multi-Group**]:

- [**Single-Group**]: only the latest set of NIBP measurements is displayed in the NIBP parameter window.
- [**Multi-Group**]: multiple sets of most recent NIBP measurements are displayed below the waveform area.



You can not display multiple sets of NIBP measurements in some screens such as the big numerics screen and the 12-lead ECG analysis screen.

11.7.3 Setting the Pressure Unit

In the [**NIBP Setup**] menu, select [**Unit**] and toggle between [**mmHg**] and [**kPa**].

11.8 Assisting Venous Puncture

You can use the NIBP cuff to cause sub-diastolic pressure to block the venous blood vessel and therefore help venous puncture.

1. In the [**NIBP Setup**] menu, verify that the [**Cuff Press.**] value is appropriate. Change it if necessary.
2. Select [**VeniPuncture**].
3. Puncture vein and draw blood sample.
4. Reselect either [**VeniPuncture**], or the hardkey on the monitor's front, or the on-screen QuickKey to deflate the cuff. The cuff deflates automatically after a set time if you do not deflate it.

During measurement, the NIBP display shows the inflation pressure of the cuff and the remaining time in venous puncture mode.

11.9 Resetting NIBP

If the blood pressure pump works incorrectly but the monitor does not alarm for it, you can check the pump by resetting it. To reset the pump, select [**Reset**] from [**NIBP Setup**].

11.10 NIBP Leakage Test

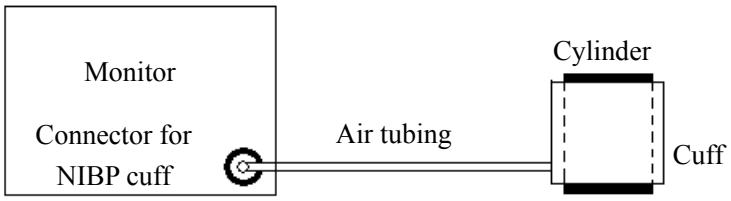
The NIBP leakage test checks the integrity of the system and of the valve. It is required at least once every two years or when you doubt the measured NIBP. If the test failed, corresponding prompt messages will be given. If no message is displayed, it means no leakage is detected.

Tools required:

- An adult cuff
- An air tubing
- A correct sized cylinder

Follow this procedure to perform the leakage test:

1. Set the patient category to [**Adu**].
2. Connect the cuff to the NIBP connector on the monitor.
3. Wrap the cuff around the cylinder as shown below.



4. Select [**Main Menu**]→[**Maintenance >>**]→[**NIBP Leakage Test**]. The NIBP display shows [**Leakage Testing…**].
5. After about 20 seconds, the monitor will automatically deflate. This means the test is completed.
6. If the message [**NIBP Pneumatic Leak**] is displayed, it indicates that the NIBP airway may have leakages. Check the tubing and connections for leakages. If you ensure that the tubing and connections are all correct, perform a leakage test again.

If the problem persists, contact your service personnel.

NOTE

- **The leakage test is intended for use to simply determine whether there are leakages in the NIBP airway. It is not the same as that specified in the EN 1060-3 standard.**

11.11 NIBP Accuracy Test

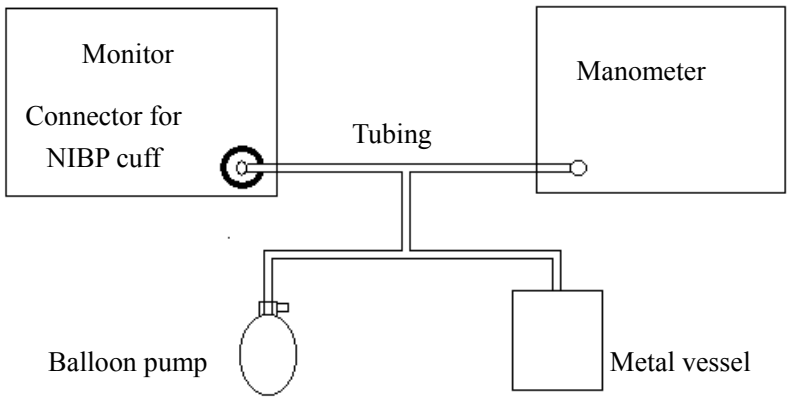
The NIBP accuracy test is required at least once every two years or when you doubt the measured NIBP.

Tools required:

- T-piece connector
- Approprating tubing
- Balloon pump
- Metal Vessel (volume 500±25 ml)
- Reference manometer (calibrated with accuracy higher than 1 mmHg)

Follow this procedure to perform the accuracy test:

1. Connect the equipment as shown.



2. Before inflation, the reading of the manometer should be 0. If not, disconnect the airway and reconnect it until the readings is 0.
3. Select [**Main Menu**]→[**Maintenance >>**]→[**NIBP Accuracy Test**].
4. Compare the manometer values with the displayed values. The difference between the manometer and displayed values should be no greater than 3 mmHg.
5. Raise the pressure in the metal vessel to 50 mmHg with the balloon pump. Repeat step 3 and 4.
6. Raise the pressure in the metal vessel to 200 mmHg with the balloon pump. Repeat step 3 and 4.

If the difference between the manometer and displayed values is greater than 3 mmHg, contact your service personnel.

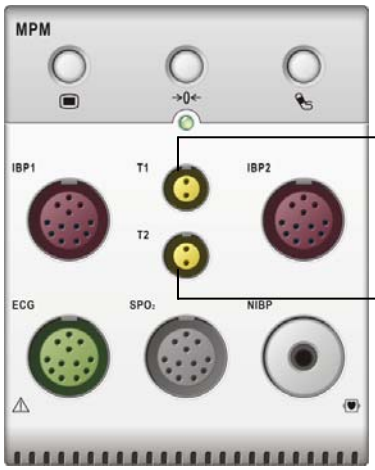
11.12 Calibrating NIBP

NIBP is not user-calibrated. Cuff-pressure transducers must be verified and calibrated once every two years by a qualified service professional. Contact your service personnel when a calibration is necessary.

12 Monitoring Temp

12.1 Introduction

You can simultaneously monitor two temperature sites using the MPM.



12.2 Safety

⚠ WARNING

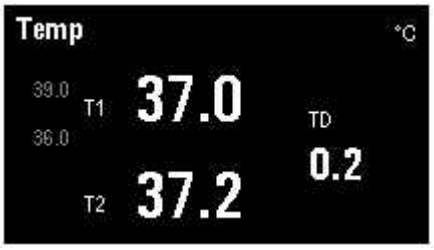
- **Verify that the probe detection program works correctly before monitoring. Plug out the temperature probe cable from the T1 or T2 connector, and the monitor can display the message [T1 Sensor Off] or [T2 Sensor Off] and give alarm tones correctly.**
- **The temperature measurement functioning should be calibrated every two years, or as indicated by your standard hospital procedure.**

12.3 Making a Temp Measurement

1. Select an appropriate probe for your patient.
2. If you are using a disposable probe, connect the probe to the temperature cable.
3 Plug the probe or temperature cable to the temperature connector.
4. Attach the probe to the patient correctly.
5. Check that the alarm settings are appropriate for this patient.

12.4 Understanding the Temp Display

The Temp Monitoring is displayed on the monitor as three numerics: T1, T2 and TD. By selecting this area, you can enter the [**Temp Setup**].



12.5 Setting the Temperature Unit

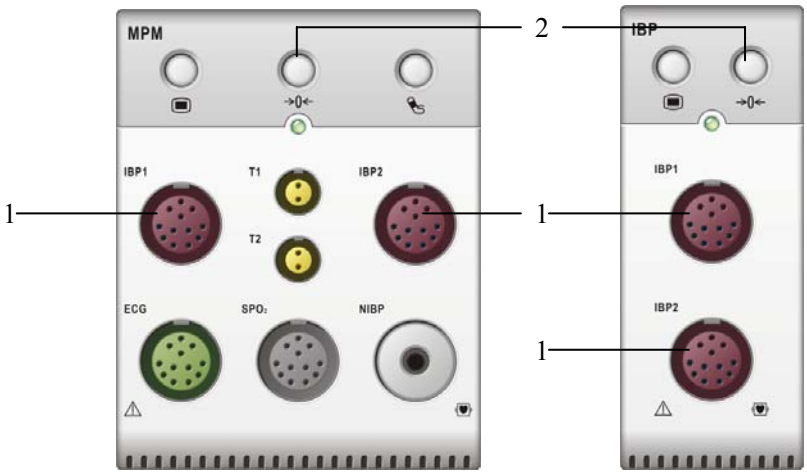
In the [**Temp Setup]** menu, select [**Unit]** and toggle between [**ºC**] and [**ºF**]

.

13 Monitoring IBP

13.1 Introduction

You can measure invasive blood pressure using the MPM, or the pressure plug-in module. The monitor can monitor up to 8 invasive blood pressures and displays the systolic, diastolic and mean pressures and a waveform for each pressure.



1. Connector for IBP cable 2. Zero key

13.2 Safety

⚠ WARNING

- **Use only pressure transducers specified in this manual. Never reuse disposable pressure transducers.**
- **Make sure that the applied parts never come into contact with other electric devices.**
- **To reduce the hazard of burns during high-frequency surgical procedure, ensure that the monitor's cables and transducers never come into contact with the high-frequency surgical units.**

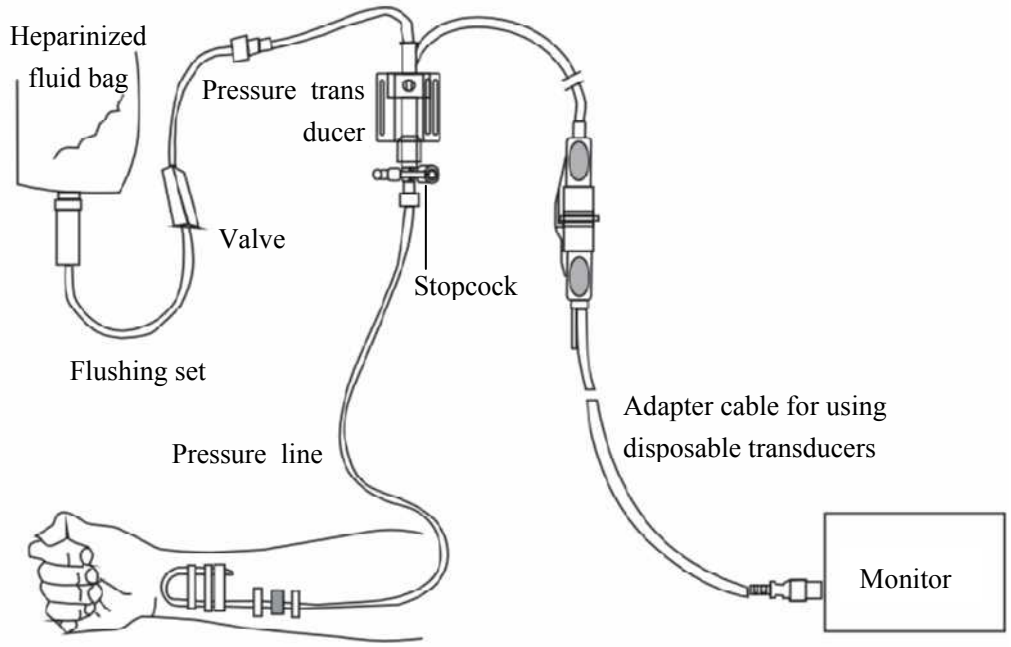
13.3 Setting Up the Pressure Measurement

1. Plug the pressure cable into the IBP connector.
2. Prepare the flush solution.
3. Flush the system to exhaust all air from the tubing. Ensure that the transducer and stopcocks are free of air bubbles.

⚠ WARNING

- **If air bubbles appear in the tubing system, flush the system with the infusion solution again. Air bubble may lead to wrong pressure reading.**

4. Connect the pressure line to the patient catheter.
5. Position the transducer so that it is level with the heart, approximately at the level of the midaxillary line.
6. Select the appropriate label.
7. Zero the transducer. After a successful zeroing, turn off the stopcock to the atmospheric pressure and turn on the stopcock to the patient.



⚠ WARNING

- **If measuring intracranial pressure (ICP) with a sitting patient, level the transducer with the top of the patient's ear. Incorrect leveling may give incorrect values.**

13.4 Understanding the IBP Display

The IBP measurement is displayed on the monitor as a waveform and numeric pressures. The figure below shows the waveform and numerics for the Art pressure. For different pressures, this display may be slightly different.

1. Waveform
2. Systolic pressure
3. Diastolic pressure
4. Mean pressure
5. Pressure unit

For some pressures, the parameter window may show the mean pressure only. For different pressures, their default unit may be different. If the Art and ICP pressures are measured simultaneously, the parameter window of the ICP display will show numeric CPP, which is obtained by subtracting ICP from the Art mean.

13.5 Changing IBP Settings

13.5.1 Changing a Pressure for Monitoring

1. Select the pressure you want to change to enter its setup menu.
2. Select [**Label**] and then select your desired label from the list. The already displayed labels cannot be selected.

Label	Description	Label	Description
PA	Pulmonary artery pressure	CVP	Central venous pressure
Ao	Aortic pressure	LAP	Left atrial pressure
UAP	Umbilical arterial pressure	RAP	Right atrial pressure
BAP	Brachial arterial pressure	ICP	Intracranial pressure
FAP	Femoral artery pressure	UVP	Umbilical venous pressure
Art	Arterial blood pressure	P1 to P8	Non-specific pressure label
Custom labels		User-defined pressure labels	

13.5.2 Defining Pressure Labels

You can define up to 8 IBP labels. Your defined labels cannot be identical with the parameter names or pressure labels already exited in the system.

1. Select [**Main Menu**]→[**Maintenance >>**]→[**User Maintenance >>**]→enter the required password→[**Define IBP Labels >>**].
2. Select, in turn, the [**Label 1**] [**Label 2**]… [**Label 8**] as necessary and then enter names.

NOTE

- **Custom labels consist of up to 3 letters and/or numerics.**

13.5.3 Choosing the Pressure Alarm Source

You can monitor for alarm conditions in systolic, diastolic and mean pressure, either singly or in parallel. In the [**IBP Setup**], select [**Alm Source]** and choose from:

- [**Sys]**: alarms are given only when the systolic pressure violates the alarm limits.
- [**Dia**]: alarms are given only when the diastolic pressure violates the alarm limits.
- [**Mean**]: alarms are given only when the mean pressure violates the alarm limits.
- [**Sys&Mean**]: alarms are given when the systolic or mean pressure violates the alarm limits.
- [**Mean&Dia**]: alarms are given when the mean or diastolic pressure violates the alarm limits.
- [**Sys&Dia**]: alarms are given when the systolic or diastolic pressure violates the alarm limits.
- [**All**]: alarms are given when the systolic or mean or diastolic pressure violates the alarm limits.

13.5.4 Changing Averaging Time

The IBP value displayed on the monitor screen is the average of data collected within a specific time. The shorter the averaging time is, the quicker the patient monitor responds to changes in the patient's blood pressure. Contrarily, the longer the averaging time is, the slower the patient monitor responds to changes in the patient's blood pressure, but the measurement accuracy will be improved. For critically ill patients, selecting shorter averaging time will help understanding the patient's state.

To set the averaging time, select [**Response**] and toggle between [**High**], [**Med**] and [**Low**], the corresponding averaging time is about 1 s, 8 s and 12 s respectively.

13.5.5 Setting the Pressure Unit

In the setup menu for the pressure, select [**Unit**] and toggle between [**mmHg**], [**cmH2O**] and [**kPa**].

13.5.6 Setting Up the IBP Wave

In the waveform menu for the pressure, you can:

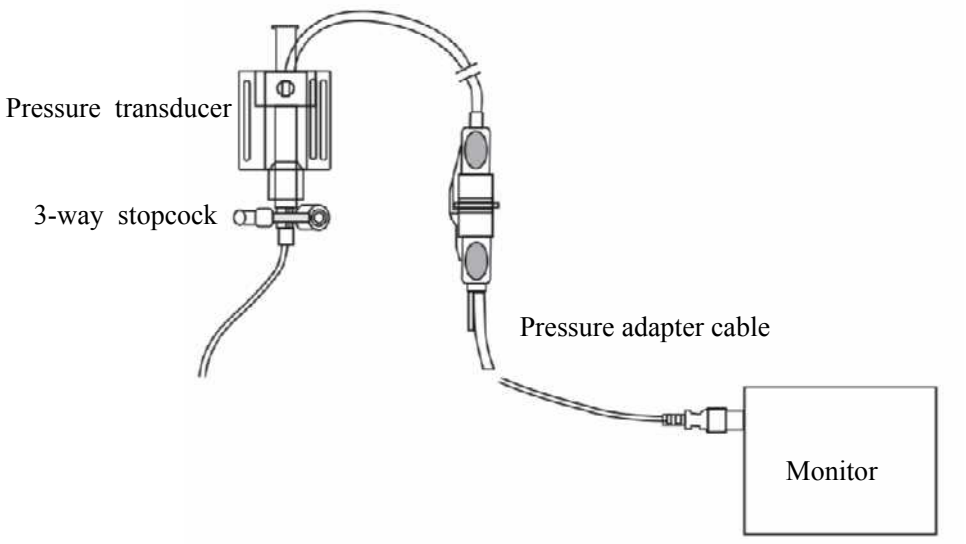
- Select [**Sweep**] and then select the appropriate setting. The faster the wave sweeps, the wider the wave is.
- Change the size of the pressure's waveform by adjusting [**Upper Scale**], [**Middle Scale**] or [**Lower Scale**].
- Select [**Filter**] and then select either:
  - [**No Filter**] to get the unfiltered IBP wave.
  - [**Normal**] to get the relatively smooth IBP wave.
  - [**Smooth**] to get the smoothest IBP wave.

13.6 Zeroing the Transducer

To avoid inaccurate pressure readings, the monitor requires a valid zero. Zero the transducer in accordance with your hospital policy (at least once per day). Zero whenever:

- A new transducer or adapter cable is used.
- You reconnect the transducer cable to the monitor.
- The monitor restarts.
- You doubt the readings.

1. Turn off the stopcock to the patient.



2. Vent the transducer to atmospheric pressure by turning on the stopcock to the air.
3. Press the →0← hardkey on the module, or, in the setup menu for the pressure (e.g. Art), select [**Art Zero** >>]→[**Zero**]. During zero calibration, the [**Zero**] button appears dimmed. It recovers after the zero calibration is completed.
4. After the zero calibration is completed, close the stopcock to the air and open the stopcock to the patient.

NOTE

- **Your hospital policy may recommend that the ICP transducer is zeroed less frequently than other transducers.**

13.7 Making the Pressure Calibration

⚠ WARNING

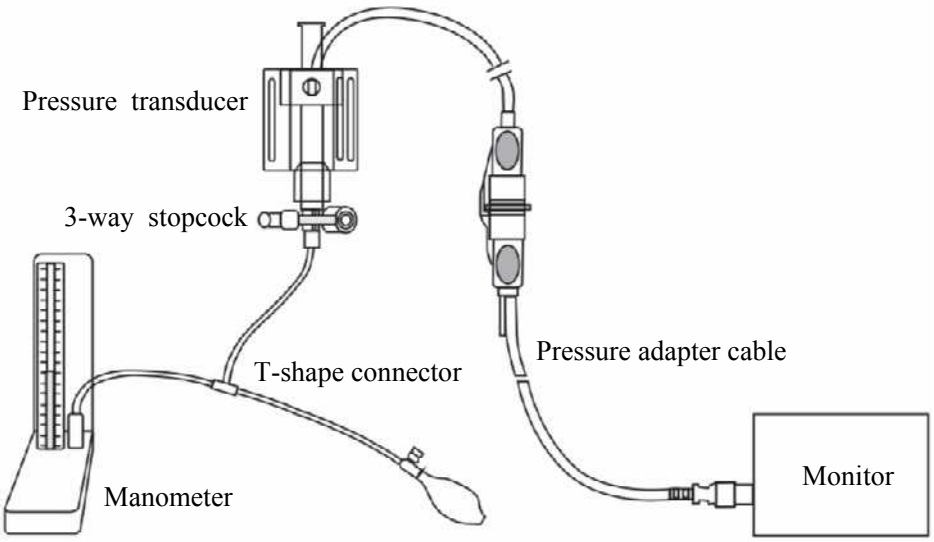
- **Never perform the invasive pressure calibration while a patient is being monitored.**

A calibration ensures accurate pressure readings. Perform a calibration when you use a new transducer, and at regular intervals according to your hospital policy. You require:

- Standard sphygmomanometer
- Balloon pump
- Tubing
- T-shape connector

Follow this procedure to perform the pressure calibration:

1. Disconnect the pressure transducer from the patient. Connect the 3-way stopcock, the sphygmomanometer and the balloon pump through a T-shape connector, as shown below.
2. Zero the transducer. After a successful zero, open the stopcock to the manometer.

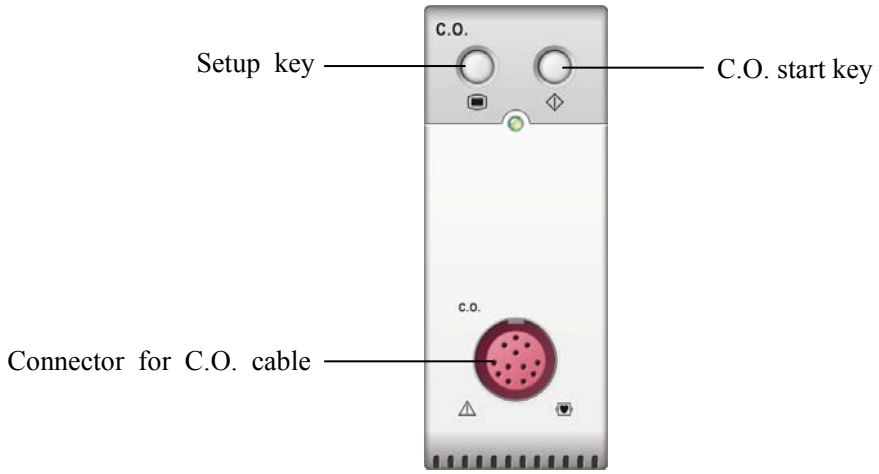


3. Select [**Main Menu**]→[**Maintenance** >>]→[**Cal**. **IBP Press.** >>]. In the [**Cal. IBP Press.**] menu, enter calibration values for calibrated pressures.
4. Inflate using the balloon pump until the mercury in the manometer reaches to the preset calibration pressure value.
5. Adjust the preset calibration value until it equals to the reading on the manometer.
6. Select the [**Calibrate**] button to the right of the calibrated pressure. The monitor starts a calibration.
7. When the calibration is completed, the message [**Calibration Completed!**] is displayed. If the calibration failed, a prompt message will be displayed.
8. After the calibration is completed, disconnect the blood pressure tubing and the T-shape connector.

14 Monitoring Cardiac Output

14.1 Introduction

The cardiac output (C.O.) measurement invasively measures cardiac output and other hemodynamic parameters using the right heart (atria) thermodilution method. A cold solution of known volume and temperature is injected into the right atrium through the proximal port of a pulmonary artery (PA) catheter. The cold solution mixes with the blood in the right ventricle and the change in blood temperature is measured with a thermistor at the distal end of the catheter in the pulmonary artery. The temperature change is displayed as a curve in the C.O. split screen, and the monitor calculates the C.O. value from this curve. The C.O. value is inversely proportional to the area under the curve. As cardiac output varies continuously, a series of measurements must be carried out to achieve a reliable C.O. average value. Always use the average of multiple thermodilution measurements for therapy decisions. The monitor is capable of storing 6 measurements.



NOTE

- **C.O. feature is not available in USA.**

14.2 Understanding the C.O. Display

The C.O. measurement is displayed on the monitor as numeric C.O. and BT in the C.O. parameter window as shown below. To enter the [**C.O. Setup**] menu, select the C.O. parameter window.

1. Temperature unit 2. Blood temperature 3. Cardiac output

14.3 Influencing Factors

The factors that affect cardiac output are:

- temperature of injectate solution,
- volume of injectate solution,
- patient's baseline blood temperature,
- patient's inspiratory/expiratory cycle,
- placement of catheter with relation to proximity of lung field,
- the catheter itself,
- the patient rhythm and hemodynamic status, and
- any other rapid IV solutions which are infused while the C.O. measurement is being performed.

Followings are some technique suggestions to obtain accurate C.O.:

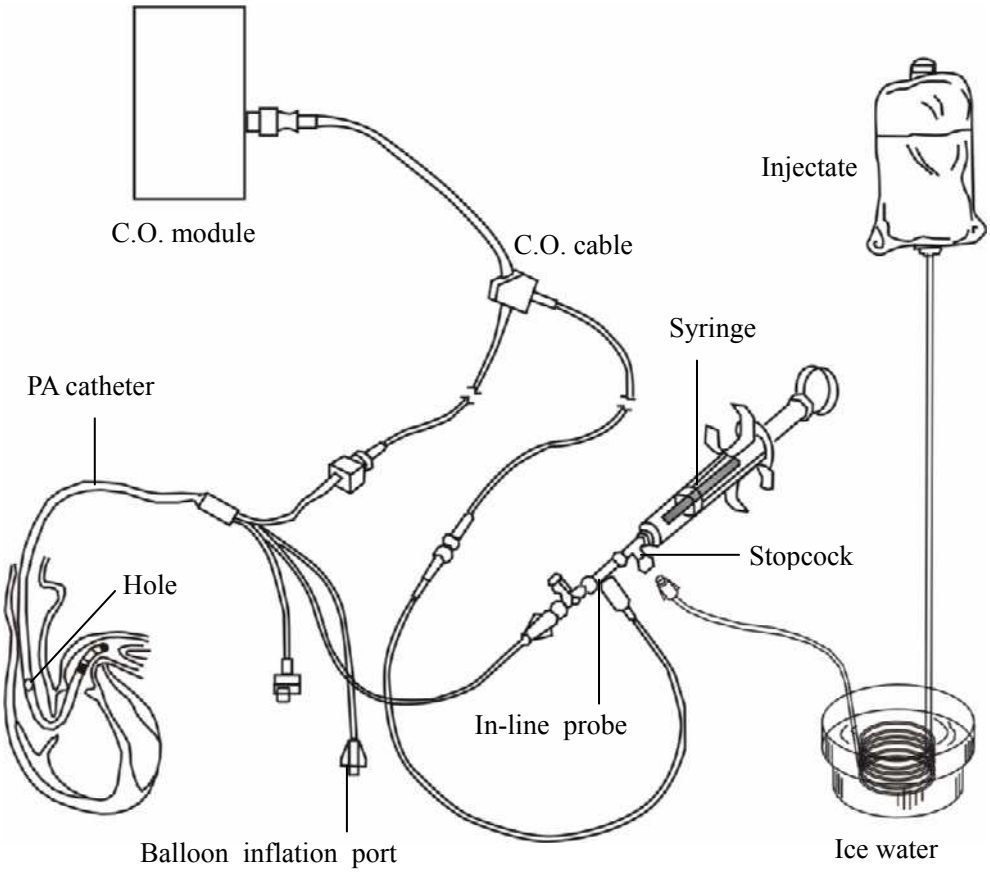
- Injectate solution must be cooler than the patient's blood.
- Inject solution rapidly and smoothly.
- Inject at end expiration.
- Wait 1 minute between injections to allow baseline to stabilized.

14.4 Setting Up the C.O. Measurement

⚠WARNING

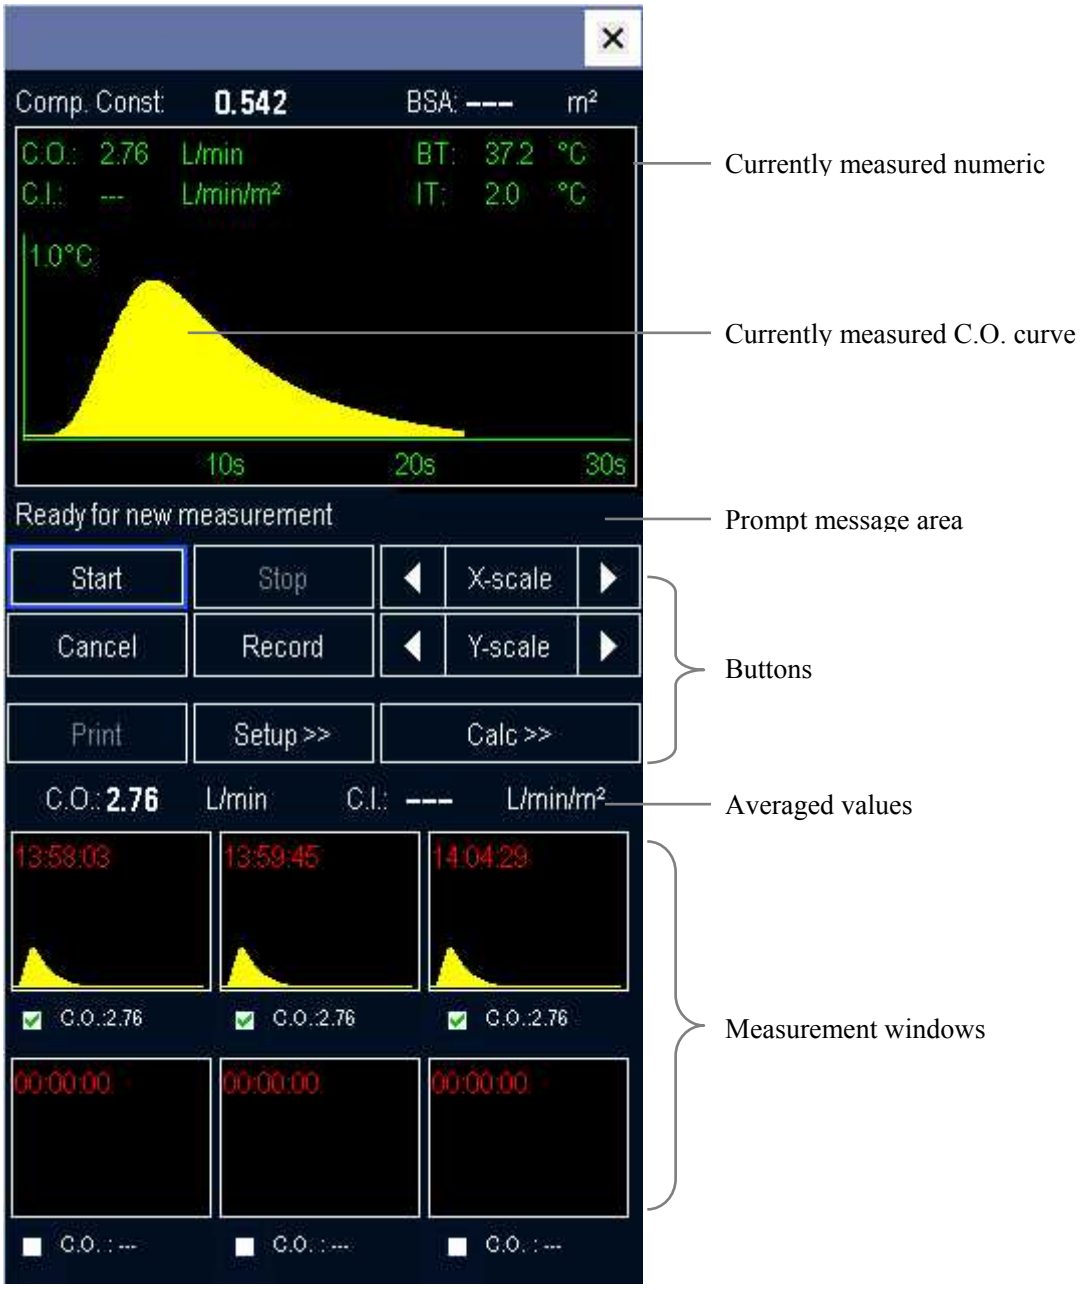
- **Use only accessories specified in this manual. Make sure that the accessories never come into contact with conductive parts.**

1. Connect the C.O. cable to the C.O. connector on the monitor.
2. Interconnect the C.O. module, catheter and syringe as shown below. Make sure that:
   - The module is securely inserted.
   - The PA catheter is in place in the patient.
   - The C.O. cable is properly connected to the module.



3. Check if the height and weight are appropriate for your patient in the [**Patient Demographics**] menu. Change if necessary.

4. Select the C.O. parameter window to enter the [**C.O. Setup**] menu. In the [**C.O. Setup**] menu:
   - Check that the correct computation constant is entered. To change the computation constant, select [**Comp. Const**] and then enter the correct value. When a new catheter is used, the computation constant should be adjusted in accordance with the manufacturer's instructions for use.
   - Switch [**Auto IT**] on and the injectate temperature is automatically obtained.
   - When [**Auto IT**]] is switched off, you can enter the injectate temperature in the [**Manual IT**] field.
5. Select [**C.O. Measure**] to enter the C.O. measurements window.



6. When you see the message [**Ready for New Measurement**], select the [**Start**] button and then inject the solution within 4 seconds. As shown in the figure above, during the measurement, the currently measured thermodilution curve is displayed. At the end of the measurement, the thermodilution curve is transferred to one of the 6 measurement windows and the monitor prompts you to wait for a certain period of time before starting a new measurement.
7. When you see the message [**Ready for New Measurement**], repeat step 5 until you have completed the measurements you want to perform. A maximum of 6 measurements can be stored. If you perform more than six measurements without rejecting any, the oldest will automatically be deleted when a seventh curve is stored. Select from the 6 measurement curves and the system will automatically calculate and display the averaged C.O. and C.I. values.

When injecting, the stopcock to the PA catheter is open and the stopcock to the injectate solution is closed. After the measurement is completed, turn off the stopcock to the PA catheter and turn on the stopcock to the injectate solution, and then draw the injectate solution into the injectate syringe.

In the buttons area, you can:

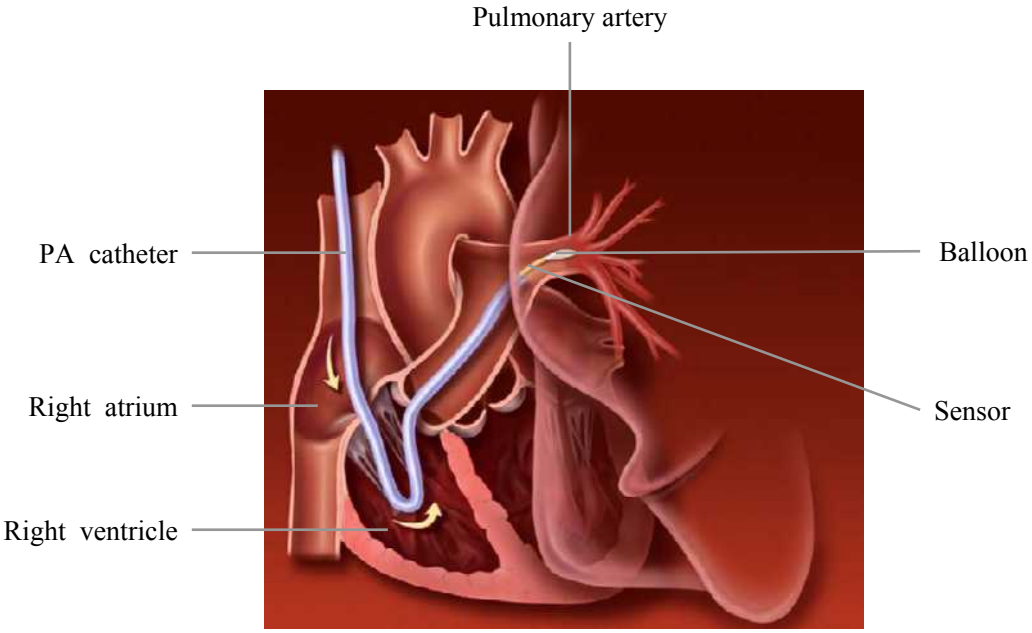
- Select [**Start**] to start a C.O. measurement.
- Select **Stop**] to stop the current measurement.
- Select [**Cancel**] during a measurement to cancel the measurement. Selecting it after a measurement deletes the measured results.
- Select [**X-Scale**] to adjust the scale of the X-axis. Options for scale range are 30 s and 60 s.
- Select [**Y-Scale**] to adjust the scale of the Y-axis. Options for scale range are 0.5ºC, 1ºC and 2.0ºC.
- Select [**Record**] to print out the most recently-measured curve and numerics by the recorder.
- Select [**Setup >>**] to access the [**C.O. Setup**] menu.
- Select [**Calc >>**] to access the [**Hemodynamic Calculation**] menu.

NOTE

- **During the cardiac output measurement, blood temperature alarms are inactive.**

14.5 Measuring the Blood Temperature

As shown below, the blood temperature is measured with a temperature sensor at the distal end of the catheter in the pulmonary artery. During C.O. measurements, blood temperature alarms are suppressed to avoid false alarms. They will automatically recover as soon as the C.O. measurements are completed.



14.6 Changing C.O. Settings

14.6.1 Setting the Temperature Unit

In the [**C.O. Setup**] menu, select [**Temp Unit**] to toggle between [**ºC**] and [**ºF**].

14.6.2 Setting the Interval between Measurements

To avoid inaccurate measurements, a certain period of time should be allowed for the blood temperature to become stable before starting a new measurement. To set the interval between two measurements, in the [**C.O. Setup**] menu, select [**Interval (s)**] and enter an appropriate value. Every time when a measurement is completed, the monitor will count down the remaining time and give corresponding prompt messages.

15 Monitoring Carbon Dioxide

15.1 Introduction

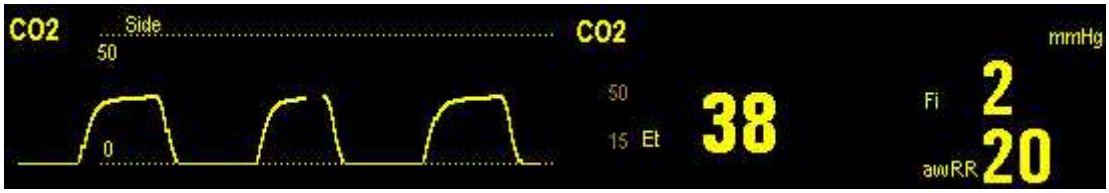
CO_2 monitoring is a continuous, non-invasive technique for determining the concentration of CO_2 in the patient' airway by measuring the absorption of infrared (IR) light of specific wavelengths. The CO_2 has its own absorption characteristic and the amount of light passing the gas probe depends on the concentration of the measured CO_2. When a specific band of IR light is passed through respiratory gas samples, some of IR light will be absorbed by the CO_2 molecules. The amount of IR light transmitted after it has been passed through the respiratory gas sample is measured with a photodetector. From the amount of IR light measured, the concentration of CO_2 is calculated.

There are two methods for measuring CO_2 in the patient's airway:

1. Mainstream measurement uses a CO_2 sensor attached to an airway adapter directly inserted into the patient's breathing system.
2. Sidestream/Microstream measurement samples expired patient gas at a constant sample flow from the patient's airway and analyzes it with a CO_2 sensor built into the CO_2 module.

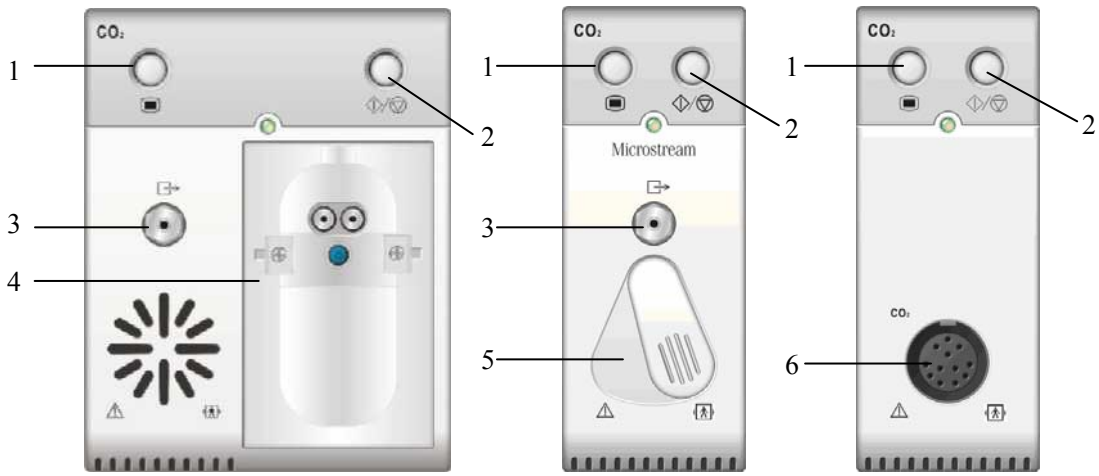
The measurement provides:

1. A CO_2 waveform
2. End tidal CO_2 value ($EtCO_2$): the CO_2 value measured at the end of the expiration phase.
3. Fraction of inspired CO_2 ($FiCO_2$): the smallest CO_2 value measured during inspiration.
4. Airway respiration rate (awRR): the number of breaths per minute, calculated from the CO_2 waveform.



15.2 Identifying CO_2 Modules

From left to right are sidestream CO_2 module, microstream CO_2 module and mainstream CO_2.



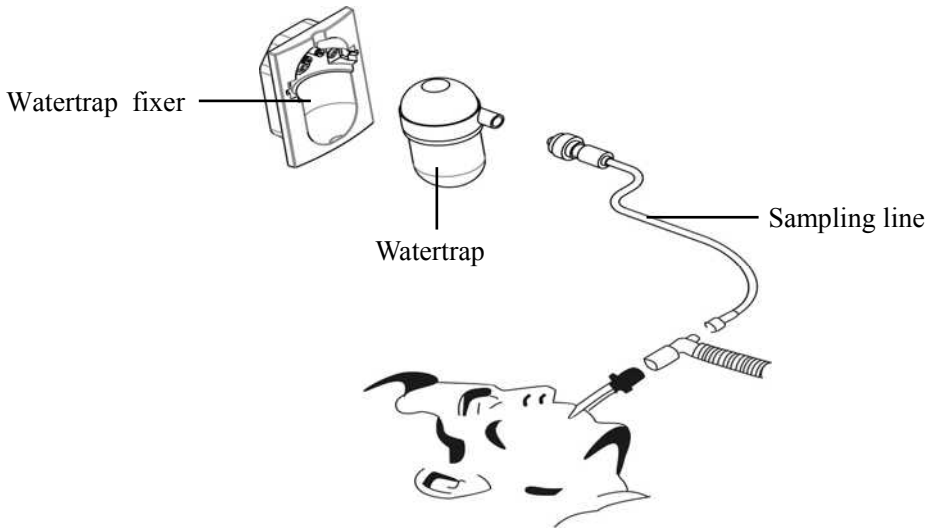
1. Setup key to enter the CO_2 setup menu
2. Measure/standby
3. Gas outlet
4. Slot for CO_2 watertrap
5. Connector for sampling line
6. Connector for CO_2 transducer

If you measure CO_2 using the AG module, see the section ***Monitoring AG***.

15.3 Preparing to Measure CO_2

15.3.1 Using a Sidestream CO_2 Module

1. Attach the watertrap to the module and then connect the CO_2 components as shown below.



2. By default, the sidestream CO_2 module is in standby mode. The [**CO_2 Standby**] message appears on the screen when the CO_2 module is plugged. To set the CO_2 module to measure mode, Select the ◇/▽ hardkey on the module to switch to the [**Measure**] mode, or select the CO_2 parameter window→[**Operating Mode**]→[**Measure**]. The message [**CO2 Startup**] is displayed.
3. After start-up is finished, the CO_2 module needs time to warm up to reach the operating temperature. The message [**CO_2 Sensor Warmup**] is displayed. If you perform CO_2 measurements during warm-up, the measurement accuracy may be compromised.
4. After warm-up is finished, you can perform CO_2 measurements.

NOTE

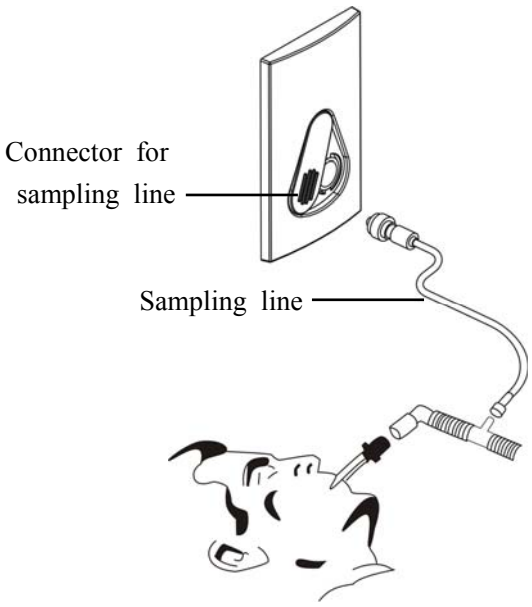
- **To extend the lifetime of the watertrap and module, disconnect the watertrap and set the operating mode to standby mode when CO_2 monitoring is not required.**

⚠CAUTION

- **The watertrap collects water drops condensed in the sampling line and therefore prevents them from entering the module. If the collected water reaches the time to empty the watertrap , you should drain it to avoid blocking the airway.**
- **The watertrap has a filter preventing bacterium, water and secretions from entering the module. After a long-term use, dust or other substances may compromise the performance of the filter or even block the airway. In this case, replace the watertrap. It is recommended to replace the watertrap once every two months, or when the watertrap is found leaky, damaged or contaminated.**

15.3.2 Using a Microstream CO_2 Module

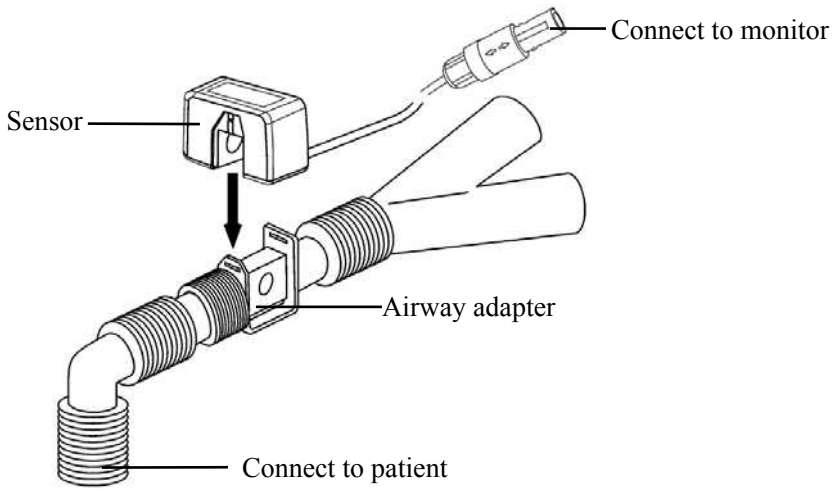
1. Connect the sampling line to the module and then connect the CO_2 components as shown below.



2. By default, the microstream CO_2 module is in measure mode. The message [**CO2 Sensor Warmup**] appears on the screen when the CO_2 module is plugged.
3. After warm-up, you can perform CO_2 measurements.

15.3.3 Using a Mainstream CO_2 Module

1. Connect the sensor to the module.
2. By default, the mainstream CO_2 module is in standby mode. The message [**CO2 Standby**] appears on the screen when the CO_2 module is plugged. To set CO_2 module to measure mode, select the hardkey on the module to switch to the [**Measure**] mode, or select the CO_2 parameter window→[**Operating Mode**]→[**Measure**]. The message [**CO2 Sensor Warmup**] is displayed.
3. After warm-up is finished, connect the transducer to the airway adapter.
4. Perform a zero calibration per the ***Zeroing the Sensor*** section.
5. After the zero calibration is finished, connect the airway as shown below.



6. Make sure there are no leakages in the airway and then start a measurement.

NOTE

- **Always position the sensor with the adapter in an upright position to avoid collection of fluids on the windows of the adapter. Large concentrations of fluids at this point will obstruct gas analysis.**

15.4 Changing CO_2 Settings

15.4.1 Accessing CO_2 Menus

- By selecting the CO_2 parameter window, you can access the [**CO2 Setup**] menu.
- By selecting the CO_2 waveform, you can access the [**CO2 Waveform**] menu.

15.4.2 Entering the Standby Mode

For sidestream or mainstream CO_2 modules, the default operating mode is measure. You can set the CO_2 module to the strandby mode. During standby, the CO_2 gas sample intake pump, infrared light, etc. are automatically switched off to extend the lifetime of the CO_2 module. When exiting the standby mode, the CO_2 module needs to warm up again. The standby mode of the CO_2 module relates to the standby mode of the monitor as follows:

- If the monitor enters the standby mode, the CO_2 module will also enter the standby mode.
- If the monitor exits the standby mode, the CO_2 module will also exit the standby mode.
- If the CO_2 module enters or exits the standby mode, it will not affect the monitor.

To enter or exit the standby mode manually,

- select the  hardkey on the module, or
- select [**Operating Mode**] in the [**CO2 Setup**] menu and then toggle between [**Standby**] and [**Measure**].

For the microstream CO2 module, you can set a period of time after which the CO2 module enters the standby mode if no breath is detected since the CO2 module is powered on or the CO2 module switchs to the measuring mode or the automatic standby time is re-set. To set the standby time, in the [**CO2 Setup**] menu, select [**Auto Standby (min)**] and then select the appropriate setting.

15.4.3 Setting the Pressure Unit

In the [**CO2 Setup**] menu, select [**Press. Unit**] and toggle between [**mmHg**], [**%**] and [**kPa**].

15.4.4 Setting up Gas Compensations

⚠WARNING

- **Make sure that the appropriate compensations are used. Inappropriate compensations may cause inaccurate measurement values and result in misdiagnosis.**

For the sidestream CO_2 module:

1. Select [**CO2 Setup**].
2. According to the actual condition, set the concentration required for the following compensations:
   - [**O2 Compen**]
   - [**N2O Compen**]
   - [**Des Compen**]

For the microstream CO_2 module, gas compensations are not required.

For the mainstream CO_2 module, in the [**CO2 Setup**] menu, respectively select:

- [**Balance Gas**] and toggle between [**Room Air**] and [**N2O**]. Select [**Room Air**] when air predominates in the ventilation gas mixture and select [**N2O**] when N_2O predominates in the ventilation gas mixture.
- [**O2 Compen**] and then select [**Off**] or an appropriate setting according to the amount of O_2 in the ventilation gas mixture. When the amount of O_2 is less than 30%, you'd better switch this compensation off.
- [**AG Compen**] and enter the concentration of anesthetic gas present in the ventilation gas mixture. This could compensate for the effect of AG on the readings.

15.4.5 Setting up Humidity Compensation

Sidestream and microstream CO_2 modules are configured to compensate CO_2 readings for either Body Temperature and Pressure, Saturated Gas (BTPS), to account for humidity in the patient's breath, or Ambient Temperature and Pressure, Dry Gas (ATPD).

1. ATPD: $P_{co2}(mmHg) = CO_2(vol\%) \times P_{amb} / 100$

2. BTPS: $P_{CO2}(mmHg) = CO_2(vol\%) \times (P_{amb} - 47) / 100$

Where, P_{CO2} = partial pressure, $vol\%$ = CO_2 concentration, P_{amb} = ambient pressure, and unit is mmHg.

As the mainstream CO_2 module has a built-in heating component to prevent water vapour from condensing, setting humidity compensation is not needed. For the sidestream and microstream CO_2 module, you can set the humidity compensation on or off according to the actual condition. To set the humidity compensation:

1. In the [**CO2 Setup**] menu, select [**Humidity Compen**].
2. Select either [**On**] for BTPS or [**Off**] for ATPD, depending on which compensation applies.

15.4.6 Setting the Apnea Alarm Delay

In the [**CO2 Setup**] menu, select [**Adjust CO2 Limits >>**]→[**Apnea Time**] and then select the appropriate setting. The monitor will alarm if the patient has stopped breathing for longer than the preset apnea time.

⚠WARNING

- **The respiration measurement does not recognize the cause of apneas. It only indicates an alarm if no breath is detected when a pre-adjusted time has elapsed since the last detected breath. Therefore, it cannot be used for diagnostic purpose.**

15.4.7 Choosing a Time Interval for Peak-Picking

For microstream and mainstream CO_2 modules, you can select a time interval for picking the highest CO_2 as the $EtCO_2$ and the lowest as the $FiCO_2$.

In the [**CO2 Setup**] menu, select [**Max Hold**] and toggle between [**Single Breath**], [**10 s**], [**20 s**] and [**30 s**].

- [**Single Breath**]: $EtCO_2$ and $FiCO_2$ are calculated for every breath.
- [**10 s**], [**20 s**] or [**30 s**]: $EtCO_2$ and $FiCO_2$ are calculated using 10, 20 or 30 seconds of data.

15.4.8 Setting the Flow Rate

For the sidestream CO2 module, you can change the sampling rate of respiratory gas in the patient's airway by setting the flow rate. To set the flow rate, enter the [**CO2 Setup**] menu and select an appropriate setting from [**Flow Rate**].

⚠WARNING

- **Please consider the patient's actual bearing capability and select the appropriate flow rate when setting the flow rate.**

15.4.9 Setting up the CO_2 Wave

In the [**CO2 Waveform**] menu, you can:

- Select [**Wave Type**] and toggle between [**Draw**] and [**Fill**]:
  - [**Draw**]: The CO_2 wave is displayed as a curved line.
  - [**Fill**]: The CO_2 wave is displayed as a filled area.
- Select [**Sweep**] and then select the appropriate setting. The faster the wave sweeps, the wider the wave is.
- Change the size of the CO_2 waveform by adjusting the wave [**Scale**].

15.5 Setting Barometric Pressure Compensation

Both sidestream and microstream CO_2 modules have the function of automatic barometric pressure compensation (the system automatically measures the barometric pressure which the patient monitor is exposed to). However, the mainstream CO_2 module does not have such function. For the mainstream CO_2 module, the default barometric pressure is 760 mmHg. You must modify the barometric pressure based on the actual situation as follows:

1. Select [**Main Menu**]→[**Maintenance >>**]→enter the required password→[**Maintain CO2 >>**]→[**Calibrate CO2 >>**].
2. Select [**Barometric Pressure**] and then enter the value of barometric pressure to which the patient monitor is exposed to.

⚠WARNING

- **Be sure to set the barometric pressure properly before using the mainstream CO_2 module. Improper settings will result in erroneous CO_2 reading.**

15.6 Measurement Limitations

The following factors may influence the accuracy of measurement:

- Leaks or internal venting of sampled gas
- Mechanical shock
- Cyclic pressure up to 10 kPa (100 cmH_2O)
- Other sources of interference, if any

15.7 Troubleshooting the Sidestream CO_2 Sampling System

When the sampling system of the sidestream CO_2 module works incorrectly, check if the sampling line is kinked. If not, remove it from the watertrap. If the monitor gives a message indicating the airway still works incorrectly, it indicates that the watertrap must have been blocked, and you should replace with a new one. Otherwise, you can determine that the sampling line must have been blocked. Replace with a new sampling line.

15.8 Removing Exhaust Gases from the System

⚠WARNING

- **Anesthetics: When using the Sidestream or Microstream CO_2 measurement on patients who are receiving or have recently received anesthetics, connect the outlet to a scavenging system, or to the anesthesia machine/ventilator, to avoid exposing medical staff to anesthetics.**

To remove the sample gas to a scavenging system, connect an exhaust tube to the gas outlet connector of the module.

15.9 Zeroing the Sensor

The zero calibration eliminates the effect of baseline drift during CO_2 measurement exerted on the readings and therefore maintains the accuracy of the CO_2 measurements.

15.9.1 For Sidestream and Microstream CO_2 Modules

For sidestream and microstream CO_2 modules, a zero calibration is carried out automatically when necessary. You can also start a manual zero calibration if necessary. To manually start a zero calibration, select [**Start Zero Cal.**] in the [**CO2 Setup**] menu. Disconnecting the patient airway is not required when performing a zero calibration.

15.9.2 For Mainstream CO_2 Modules

For mainstream CO_2 modules, zero the sensor whenever:

- A new adapter is used;
- You reconnect the sensor to the module;
- You see the message [**CO2 Zero Required**]. In this case, check the airway adapter for any blockage, e.g. mucus, etc. If a blockage is detected, clear or replace the adapter.

To zero the sensor, follow this procedure:

1. Connect the sensor to the module.
2. In the [**CO2 Setup**] menu, set the [**Operating Mode**] to [**Measure**]. The message [**CO2 Sensor Warmup**] is displayed.
3. After warm-up is finished, connect the sensor to a clean, dry airway adapter. The adapter should be vent to the air and isolated from CO_2 sources, such as ventilator, the patient's breathing, your own breathing, etc.
4. Select [**Start Zero Cal.**] in the [**CO2 Setup**] menu. The message [**CO2 Zero Running**] is displayed.
5. It takes about 15 to 20 seconds. The message disappears when the zero calibration is completed.

⚠WARNING

- **When perform a zero calibration during the measurement, disconnect the transducer from the patient's airway first.**

15.10 Calibrating the Sensor

For sidestream or microstream CO_2 modules, a calibration should be performed once every year or when the readings go far beyond the range. For mainstream CO_2 modules, no calibration is required. For details, refer to the chapter ***28 Maintenance***.

15.11 Oridion Information

Microstream

This trademark is registered in Israel, Japan, German and America.

Oridion Patents

This device and the CO_2 sampling consumables designed for use herewith is covered by one or more of the following USA patents: 4,755,675; 5,300,859; 5,657,750; 5,857,461 and international equivalents. USA and international patents pending.

No Implied License

Possession or purchase of this device does not convey any express or implied license to use the device with unauthorized CO_2 sampling consumables which would, alone, or in combination with this device, fall within the scope of one or more of the patents relating to this device and/or CO_2 sampling consumable.

FOR YOUR NOTES

16 Monitoring AG

16.1 Introduction

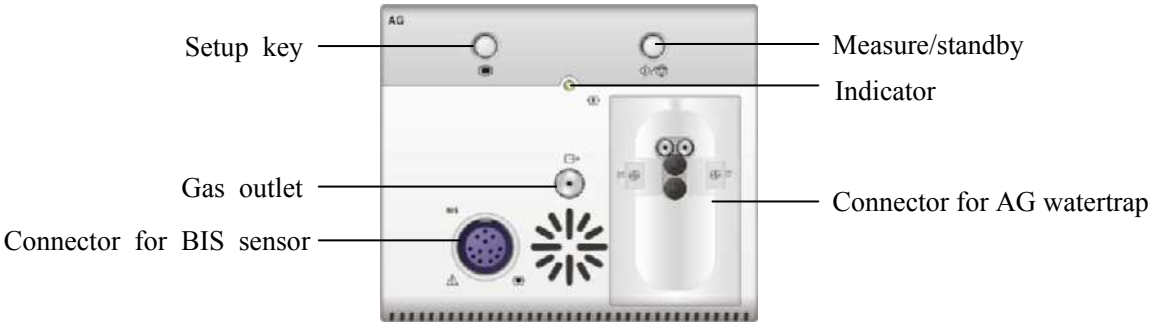
The anaesthetic gas (AG) module measures the patient's anesthetic and respiratory gases, and incorporates the features of the O_2 module and BIS module as well.

The AG module determines the concentration of certain gases using the infrared (IR) light absorption measurement. The gases that can be measured by the AG module absorb IR light. Each gas has its own absorption characteristic. The gas is transported into a sample cell, and an optical IR filter selects a specific band of IR light to pass through the gas. For multiple gas measurement, there are multiple IR filters. The higher the concentration of gas in a given volume the more IR light is absorbed. This means that higher concentration of IR absorbing gas cause a lower transmission of IR light. The amount of IR light transmitted after it has been passed though an IR absorbing gas is measured. From the amount of IR light measured, the concentration of gas present can be calculated.

Oxygen does not absorb IR light as other breathing gases and is therefore measured relying on its paramagnetic properties. Inside the O_2 sensor are two nitrogen-filled glass spheres mounted on a strong rare metal taut-band suspension. This assembly is suspended in a symmetrical non-uniform magnetic field. In the presence of paramagnetic oxygen, the glass spheres are pushed further away from the strongest part of the magnetic field. The strength of the torque acting on the suspension is proportional to the oxygen concentration. From the strength of the torque, the concentration of oxygen is calculated.

16.2 Identifying AG Modules

There are two AG modules: M-type and A-type. The M-type module cannot automatically identify anesthetic gases, but the A-type module can.

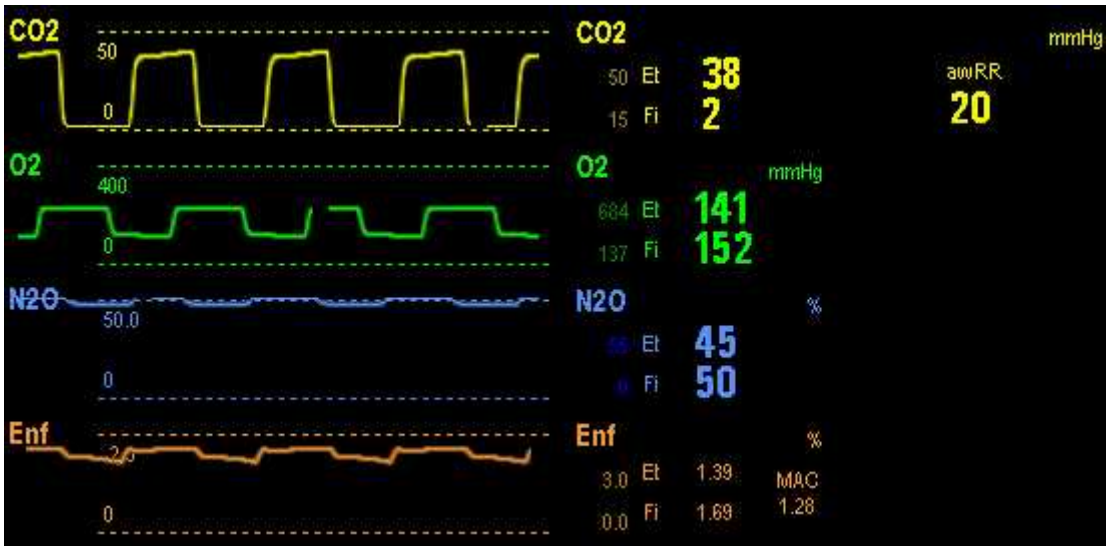


For details on BIS, refer to the chapter ***18 Monitoring BIS***.

NOTE

- **The AG module is configured with automatic barometric pressure compensation function.**

16.3 Understanding the AG Display



The AG module can send waves and numerics for all measured anesthetic gases for display on the monitor, including:

- CO_2, O_2, N_2O and AA waves
- awRR: airway respiratory rate
- MAC: minimal alveolar concentration
- End tidal (Et) and fraction of inspired (Fi) numerics for CO_2, O_2, N_2O and AA

Where AA represents Des (desflurane), Iso (isoflurane), Enf (enflurane), Sev (sevoflurane), or Hal (halothane).

⚠WARNING

- **The M-type module can measure only one of the five anesthetic gases at one time. The A-type module can measure the mixture of any two of the five anesthetic gases at one time; however, only the value of the primary anesthetic gas is displayed.**

16.4 MAC Values

Minimum alveolar concentration (MAC) is the minimum concentration of the agent in the alveoli. It is a basic index to indicate the depth of anesthesia. The standard ISO 21647 defines MAC as this: alveolar concentration of an inhaled anesthetic agent that, in the absence of other anesthetic agents and at equilibrium, prevents 50% of patients from moving in response to a standard surgical stimulus.

Minimum alveolar concentration (MAC) values are listed below:

Agent	Des	Iso	Enf	Sev	Hal	N2O
1 MAC	7.3%*	1.15%	1.7%	2.1%	0.77%	105%**

* The data is taken from a patient of 25 years old.

** indicates 1 MAC nitrous oxide can only be reached in hyperbaric chamber.

NOTE

- **The MAC values shown in the table above are those published by the U.S. Food and Drug Administration for a healthy 40-year-old adult male patient.**
- **In actual applications, the MAC value may be affected by age, weight and other factors.**

The formula to calculate the MAC value is as follows:

$$MAC = \sum_{i=0}^{N-1} \frac{EtAgent_i}{AgentVol_i}$$

Where N is the number of all agents (including N_2O) that the AG module can measure, EtAgenti is the concentration of each agent and AgentVoli is the concentration of each agent at 1 MAC.

For example, the AG module measures there are 4% of Des, 0.5% of Hal and 50% of N_2O in the patient's end-tidal gas:

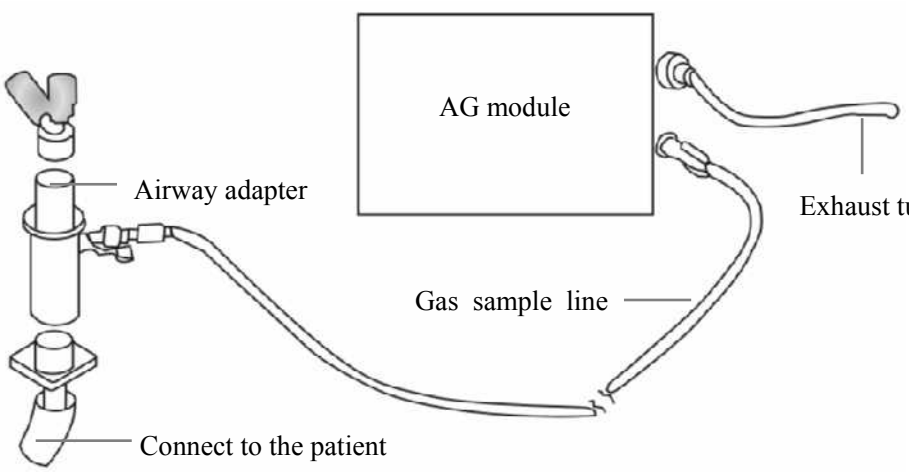
$$MAC = \frac{4.0\%}{7.3\%} + \frac{0.5\%}{0.77\%} + \frac{50\%}{105\%} = 1.67$$

NOTE

- **The formula mentioned above is intended for adult patients only.**

16.5 Preparing to Measure AG

1. Select an appropriate watertrap according to patient category and attach it to the module.
2. Connect the gas sample line to the connector of the watertrap.
3. Connect the other end of the gas sampling line to the patient via the airway adapter.
4. Connect the gas outlet to a scavenging system using an exhaust tube.



5. Insert the AG module into the SMR or the patient monitor and the patient monitor will prompt [**AG Startup**]. After startup is finished, [**AG Warmup**] is prompted. Then the AG module enters the iso accuracy mode. After that, the module enters the full accuracy mode.

⚠CAUTION

- **Position the airway adapter so that the part connecting to the gas sample line is pointing upwards. This prevents condensed water from passing into the gas sample line and causing an occlusion.**
- **The watertrap collects water drops condensed in the sampling line and therefore prevents them from entering the module. If the collected water reaches to a certain amount, you should drain it to avoid blocking the airway.**
- **The watertrap has a filter preventing bacterium, water and secretions from entering the module. After a long-term use, dust or other substances may compromise the performance of the filter or even block the airway. In this case, replace the watertrap. Replacing the watertrap once a month is recommended.**

⚠WARNING

- **Make sure that the connections are tight. Any leak in the system can result in erroneous readings due to ambient air mixing with patient gases.**
- **Do not apply adult watertrap to the neonate patient. Otherwise, patient injury could result.**

16.6 Changing AG Settings

16.6.1 Accessing AG Menus

- By selecting the CO_2, O_2 or N_2O parameter window, you can respectively access the [**CO2 Setup**], [**O2 Setup**] or [**N2O Setup**] menu. By selecting the CO_2, O_2 or N_2O waveform area, you can respectively access the [**CO2 Waveform**], [**O2 Waveform**] or [**N2O Waveform**] menu.
- For the M-type module, the parameter window and waveform area labeled with [**AA**] are displayed if no anesthetic agent is already selected. By selecting the parameter window or waveform area, you can access the [**AA Setup**] or [**AA Waveform**] menu.
- For the A-type module, the parameter window and waveform area with a specific anesthetic gas label are displayed. By selecting the parameter window or waveform area, you can access that gas's setup or waveform menu.

16.6.2 Selecting an Anesthetic Gas for Monitoring

As the M-type module cannot automatically identify 5 anesthetic gases, you need to select an anesthetic gas before use. To select the anesthetic gas, in the [**AA Setup**] menu, select [**Agent**] and then select the appropriate setting.

16.6.3 Setting the Apnea Alarm Delay

In the setup menu for any gas, select [**Apnea Time**] and select the appropriate setting. The monitor will alarm if the patient has stopped breathing for longer than the preset apnea time.

⚠WARNING

- **The respiration measurement does not recognize the cause of apneas. It only indicates an alarm if no breath is detected when a pre-adjusted time has elapsed since the last detected breath. Therefore, it cannot be used for diagnostic purpose.**

16.6.4 Changing the Sample Flow Rate

In the setup menu for any gas, select [**Flow Rate**] and then choose either:

- [**High**]: 200 ml/min for adult and pediatric patients, and 120 ml/min for neonatal patients.
- [**Med**]: 150 ml/min for adult and pediatric patients, and 90 ml/min for neonatal patients.
- [**Low**]: 120 ml/min for adult and pediatric patients, and 70 ml/min for neonatal patients.

16.6.5 Setting up the O_2 Compensation

If the AG module does not incorporate the O_2 module, you need to manually select [**O2 Compen**] and then select [**Off**] or an appropriate setting according to the amount of O_2 in the ventilation gas mixture. When the amount of O_2 is less than 30%, you'd better switch this compensation off.

If the AG module incorporates the O_2 module, the system will directly use the O_2 concentration detected by the O_2 module to make compensation. At this time, the [**O2 Compen**] in the setup menu for any gas is fixed to [**Off**].

16.6.6 Entering the Standby Mode

For the AG module, the default operating mode is measure. You can set the AG module to the strandby mode. During standby, the AG gas sample intake pump is automatically switched off to extend the lifetime of the AG module. When exiting the standby mode, the AG module needs to warm up again. The standby mode of the AG module relates to the standby mode of the monitor as follows:

- If the monitor enters the standby mode, the AG module will also enter the standby mode.
- If the monitor exits the standby mode, the AG module will also exit the standby mode.
- If the AG module enters or exits the standby mode, it will not affect the monitor.

To enter or exit the standby mode manually, in the agent's setup menu, select [**Operating Mode**] and then toggle between [**Standby**] and [**Measure**]. You can also set a period of time after which the AG module enters the standby mode automatically if no breath is detected since the last detected breath. To set the standby time, in the agent's setup menu, select [**Auto Standby (min)**] and then select the appropriate setting.

16.6.7 Setting up the AG Wave

Select a gas' waveform area to enter its waveform menu. In this menu, you can:

- Select [**Wave Type**] and toggle between [**Draw**] and [**Fill**] (This option is for CO_2 only):
  - [**Draw**]: The CO_2 wave is displayed as a curved line.
  - [**Fill**]: The CO_2 wave is displayed as a filled area.
- Select [**Sweep**] and then select the appropriate setting. The faster the wave sweeps, the wider the wave is.
- Change the size of the waveform by adjusting the [**Scale**].

16.7 Changing the Anesthetic Agent

When the anesthetic agent used on the patient is changed, the AG module can detect the mixed anesthetic gas during the transition of two anesthetic agents. The time required for completing the replacement of anesthetic agent depends on anesthesia type (low flow or high flow) and the characteristics of anesthetic agents (pharmacokinetics). During the transition of two anesthetic agents, the patient monitor gives no prompt messages and the MAC value displayed may be inaccurate.

The M-type AG module cannot identify anesthetic agents automatically. Accordingly, you must change the setting of [**Agent**] in the corresponding menu to achieve the consistency between the preset anesthetic agent and the actually used one.

The A-type AG module can identify anesthetic agents automatically. When one anesthetic agent drops below the threshold and another anesthetic agent becomes dominant, the patient monitor will automatically identify such change and display the name and data of the dominant anesthetic agent.

16.8 Measurement Limitations

The following factors may influence the accuracy of measurement:

- Leaks or internal venting of sampled gas
- Mechanical shock
- Cyclic pressure up to 10 kPa (100 cmH_2O)
- Other sources of interference, if any

16.9 Troubleshooting

16.9.1 When the Gas Inlet is Blocked

If the gas inlet (including watertrap, sampling line and airway adapter) is occluded by condensed water, the message [**AG Airway Occluded**] will appear.

To remove the occlusion:

- Check the airway adapter for an occlusion and replace if necessary.
- Check the sampling line for an occlusion or kinking and replace if necessary.
- Check the watertrap for a build up of water. Empty the watertrap. If the problem persists, replace the watertrap.

16.9.2 When Internal Occlusions Occurs

Condensed water may enter the module and cause contamination and/or internal occlusions. In this case, the message [**AG Airway Occluded**] will be displayed.

To remove the occlusion:

- Check for any occlusion in the gas inlet and/or outlet system.
- If the problem persists, internal occlusions may exist. Contact your service personnel.

16.10 Removing Exhaust Gases from the System

⚠WARNING

- **Anesthetics: When using the AG measurement on patients who are receiving or have recently received anesthetics, connect the outlet to a scavenging system, or to the anesthesia machine/ventilator, to avoid exposing medical staff to anesthetics.**

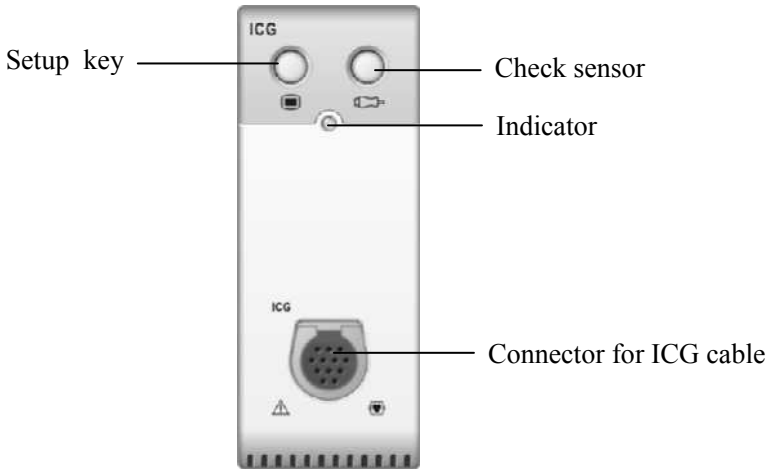
To remove the sample gas to a scavenging system, connect an exhaust tube to the gas outlet connector of the module.

FOR YOUR NOTES

17 Monitoring ICG

17.1 Introduction

Impedance cardiography (ICG) measures a patient's hemodynamic status using a safe, non-invasive method based on thoracic electrical bioimpedance (TEB) technology. ICG uses four pairs of sensors to transmit a small electrical signal through the thorax. As velocity and volume of blood in the aorta change, the ICG measures the changes in impedance from systole to diastole to calculate hemodynamic parameters.



17.2 Safety

⚠ WARNING

- **Apply ICG monitoring to adult patients in height of 122 to 229 cm, weight of 30 to 159 kg (67 to 341 pounds) only.**
- **ICG monitoring should not be used concurrently on patients with minute ventilation pacemakers when the MV sensor function is activated.**
- **During ICG monitoring, make sure that the conductive paste on the ICG sensors never come into contact with other conductive parts.**
- **ICG sensors are for single patient use only.**

17.3 Understanding ICG Parameters

By selecting the ICG parameter window→[**ICG Setup**]→[**Hemodynamic Parameters** >>], you can view the hemodynamic parameters for evaluation of the patient's hemodynamic status.

17.3.1 Measured Parameters

Abbreviation	**Unit**	**Full spelling**
ACI	/100s^2	acceleration index
VI	/1000s	velocity index
PEP	ms	Pre-ejection period
LVET	ms	Left ventricular ejection time
TFI	Ω	Thoracic fluid index
TFC	/kΩ	thoracic fluid content
HR*	bpm	heart rate
*The HR value is directly derived from the ICG module.		

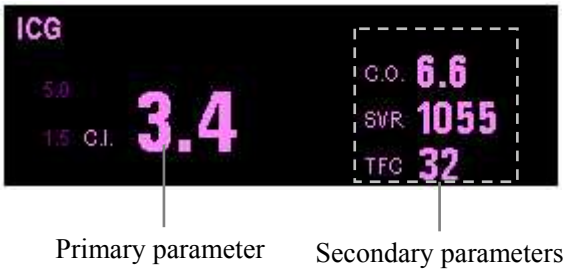
17.3.2 Calculated Parameters

Abbreviation	**Unit**	**Full spelling**
BSA	m^2	Body surface area
C.O.	L/min	Cardiac output
C.I.	L/min/m^2	Cardiac index
SV	ml	Stroke volume
SI	ml/m^2	Stroke index
SVR	DS/cm^5	Systemic vascular resistance
SVRI	DS·m^2/cm^5	Systemic vascular resistance index
PVR	DS/cm^5	Pulmonary vascular resistance
PVRI	DS·m^2/cm^5	Pulmonary vascular resistance index
LCW	kg·m	Left cardiac work
LCWI	kg·m/m^2	Left cardiac work index

Abbreviation	Unit	Full spelling
LVSW	g·m	Left ventricular stroke work
LVSWI	g·m/m^2	Left ventricular stroke work index
STR	none	Systolic time ratio
VEPT	ml	Volume of electrically participating tissue

17.4 Understanding the ICG Display

The ICG monitoring provides a continuous display of the impedance waveform and four numerics. Of four numerics, one is the primary parameter C.I. and the other three are secondary parameters. The secondary parameters are user-selectable, and C.O., SVR and TFC are the defaults.



By selecting the ICG waveform area and ICG parameter window, you can access the [**ICG Waveform**] and [**ICG Setup**] menus respectively..

17.5 ICG Limitations

The measurement accuracy may be compromised when patients present with the following conditions or anomalies:

- Septic shock.
- Aortic valve regurgitation.
- Severe hypertension (Art mean>130 mmHg).
- The patient's weight and height are out of range.
- Connection to an intra-aortic balloon pump.
- With excessive and continuous patient movements such as shivering.
- Signal interference from cable connections and/or power cords.
- Open-chest surgeries that could result in changes in the normal pattern of blood flow and/or the electrical current through the chest cavity.

17.6 Preparing to Monitor ICG

1. Insert the ICG module into the monitor.
2. Connect the patient cable to the ICG module.
3. Prepare the patient's skin and place ICG sensors on the patient.
4. Connect the ICG sensor connector end to the patient cable lead wires.
5. Enter the patient information.

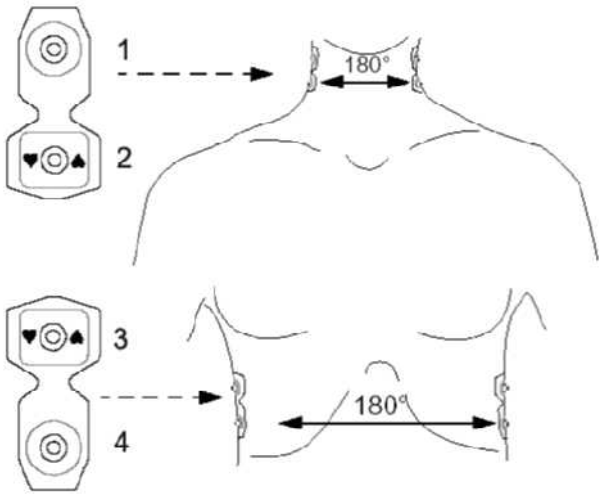
17.6.1 Preparing the Patient

Proper skin preparation is necessary for good signal quality at the sensor, as the skin is a poor conductor of electricity. To properly prepare the skin, choose flat, non-muscular areas and then follow this procedure:

1. Shave hair from skin at chosen sites.
2. Gently rub skin surface with a gauze pad at sites to remove dead skin cells.
3. Thoroughly cleanse the site with a mild soap and water solution. Be sure to remove all oily residue, dead skin cells, and abrasives. Leftover abrasion particles can be a source of noise.
4. Dry the skin completely before applying the sensor.

17.6.2 Placing ICG Sensors

Appropriate sensor placement is important for good signal quality and accurate measurements. Attach ICG sensors to the patient as shown below:



1. Two neck sensors placed on each side of the neck, with the rectangular shaped end of the sensor (2) placed at the base (or root) of the neck and the circular shaped end of the sensor (1) placed directly superior and in line with the earlobe.
2. Two thorax sensors placed on each side of the thorax, with the rectangular shaped end of the sensor (3) at the level with the xyphoid process and the circular shaped end of the sensor (4) directly inferior and in line with the midaxillary line. Each pair of sensors should be opposite directly to each other (180°) as shown in the figure above.

17.6.3 Setting up the Patient Information

1. Select the ICG parameter window to enter the [**ICG Setup**] menu.
2. Select [**Patient Demographics >>**].
3. Select [**Height**] and [**Weight**] and then select the appropriate settings. The patient's height and weight are important for ICG monitoring. The system will automatically check them when an ICG module is connected. If no values are entered or the entered values do not meet the requirements, corresponding prompt messages will be given in the ICG parameter window.
4. If the mean arterial blood pressure (Art mean) is not obtained automatically from either IBP or NIBP module, then enter Art mean. Enter CVP and PAWP, obtained from invasive catheters or enter an assumed value. (Note: CVP and PAWP are used only in the calculation of SVR, SVRI, LCW, LCWI, LVSW, and LVSWI and the value of CVP and PAWP do not normally have a significant effect on the calculated parameters.)

17.7 Changing ICG Settings

17.7.1 ICG Averaging

The ICG value is the average of multiple measurements. You can select an interval (heart beats) for averaging ICG, ranging from 5-60 beats.

1. Select the ICG parameter window to enter the [**ICG Setup**] menu.
2. Select [**Averaging**] and then select the appropriate setting. The greater the averaging interval is, the less the ICG value is affected by human interference and vice versa.

17.7.2 Selecting Secondary Parameters

C.O., SVR and TFC are the default three secondary parameters. You can also select your desired secondary parameter for display.

1. Select the ICG parameter window to enter the [**ICG Setup**] menu.
2. Select [**Change Secondary Parameters** >>].
3. Select three parameters from the popup menu.

17.7.3 Checking Sensors

During ICG monitoring, the ICG sensors should be checked regularly to ensure that no sensor becomes disconnected. During sensor checking, the ICG waveform is displayed as a straight line and the message [**ICG Sensor Check**] is displayed. Once a disconnected sensor is detected, a prompt message in which the sensor's application site is indicated will be displayed.

To initiate a sensor check:

- In the [**ICG Setup**] menu, select [**Check Sensor**].
- Press the  hardkey.

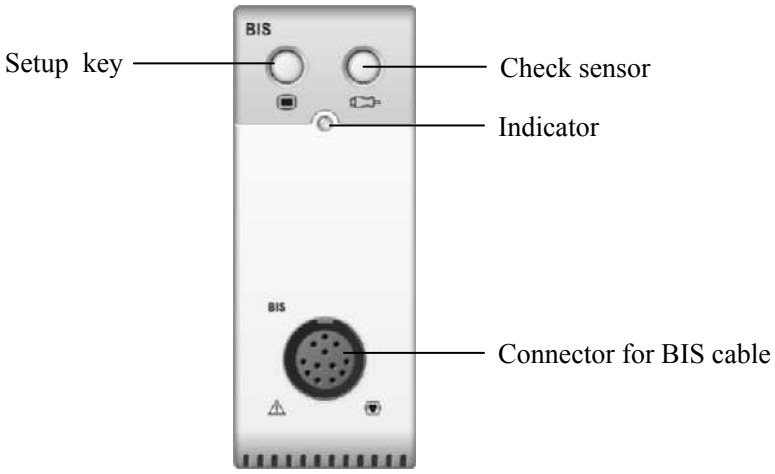
17.7.4 Changing the ICG Wave Speed

1. Select the ICG wave to enter the [**ICG Waveform**] menu.
2. Select [**Sweep**] and then select the appropriate setting. The faster the wave sweeps, the wider the wave is.

18 Monitoring BIS

18.1 Introduction

Bispectral Index (BIS) monitoring helps to monitor the level of consciousness of a patient under general anesthesia or sedation in the OR and ICU. The BIS sensor is placed on the patient's forehead to capture electroencephalographic (EEG) signals from which several numerics are derived, including a single BIS between 100 (wide awake) and zero (absence of brain electrical activity) that represents the patient's level of consciousness. This enables clinicians to customize the precise type and amount of anesthetic or sedative medication that each patient needs.



18.2 Safety Information

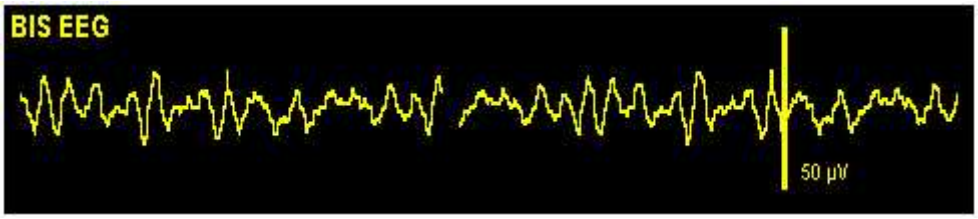
For patients with neurological disorders, patients taking psychoactive medication, and children below the age of 1 year, BIS values should be interpreted cautiously.

⚠WARNING

- **The conductive parts of sensors and connectors should not come into contact with other conductive parts, including earth.**
- **To reduce the hazard of burns in the high-frequency surgical neutral electrode connection, the BIS sensor should not be located between the surgical site and the electro-surgical unit return electrode.**
- **The BIS sensor must not be located between defibrillator pads when a defibrillator is used on a patient connected to the patient monitor.**

18.3 Understanding the BIS Display

The BIS module provides with the monitor an EEG wave and the following numerics:



1. Bispectral Index (BIS)

   The BIS numeric reflects the patient's level of consciousness. It ranges from 100 for wide awake to 0 in the absence of brain activity.

BIS numeric	Description
100	The patient is widely awake.
70	The patient is underdosed but still unlikely to become aware.
60	The patient is under general anesthesia and loses consciousness.
40	The patient is overdosed and in deep hypnosis.
0	The EEG waveform is displayed as a flat line, and the patient has no electrical brain activity.

2. Electromyograph (EMG)

   EMG bar graph reflects the electrical power of muscle activity and high frequency artifacts. The minimum possible EMG is about 25 dB.

   - EMG＜55 dB: this is an acceptable ECG.
   - EMG≤30 dB: this is an optimal EMG.

3. Suppression Ratio (SR)

   SR numeric is the percentage of time over the last 63-second period during which the EEG is considered to be in a suppressed state.

4. Spectral Edge Frequency (SEF)

   The SEF is a frequency below which 95% of the total power is measured.

5. Signal Quality Index (SQI)

   The SQI numeric reflects signal quality and provides information about the reliability of the BIS, SEF, TP, and SR numerics during the last minute. It ranges from 0-100%:

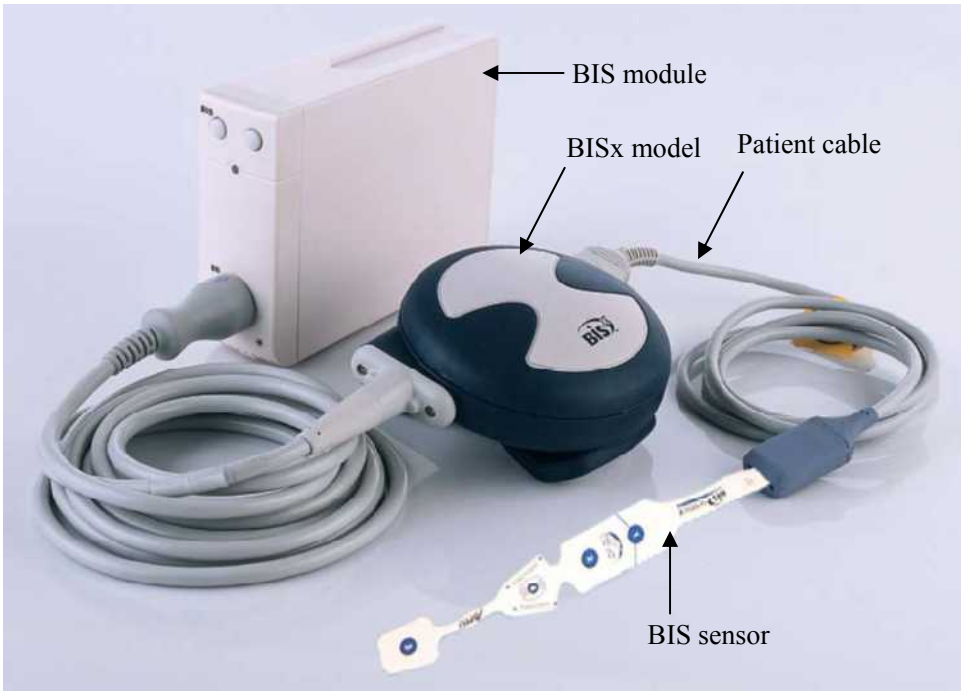
   - 0 to 15%: the numerics cannot be derived.
   - 15% to 50%: the numerics cannot be reliably derived.
   - 50% to 100%: the numerics are reliable.

6. Total Power (TP)

   TP numeric indicates the power in the frequency band 0.5-30Hz. The useful range is 30-100db.

18.4 Setting up the BIS Measurement

1. Connect the BISx model to the BIS module.



2. Use the attachment clip to secure the BISx model near, but not above the level of the patient's head.
3. Connect the BISx model to the patient cable.
4. Attach the BIS sensor to the patient following the instructions supplied with sensor.

NOTE

- **Make sure the patient's skin is dry. A wet sensor or a salt bridge could result in erroneous BIS and impedance values.**

5. Connect the BIS sensor to the patient interface cable. As soon as a valid sensor is detected, the impedances of all electrodes are measured automatically and the impedance value for each electrode is displayed in the sensor check window.

⚠CAUTION

- **Do not attach the BISx model to the patient's skin for long time. Otherwise, the BISx heats while on the patient and may cause discomfort.**

18.5 Continuous Impedance Check

By default, this check is switched on. It checks:

- The combined impedance of the signal electrodes plus the reference electrode. This is done continuously and does not affect the EEG wave. As long as the impedances are within the valid range, there is no prompt message of this check or its results.
- The impedance of the ground electrode. This is done every ten minutes and takes approximately four seconds. It causes an artifact in the EEG wave, and the message [**BIS Ground Checking**] is displayed on the monitor during the check. If the ground electrode does not pass this check, another check is initiated. This continues until the ground electrode passes the check.

If the continuous impedance check interferes with other measurements, it can be switched off. To do this:

1. Select the BIS parameter window to enter the [**BIS Setup]** menu.
2. Select [**Cont. Imped.Check**] and then select [**Off**].

⚠CAUTION

- **Switching the continuous impedance check off will disable automatic prompt to the user of impedance value changes, which may lead to incorrect BIS values. Therefore, this should only be done if the check interferes with or disturbs other measurements.**

18.6 Cyclic Impedance Check

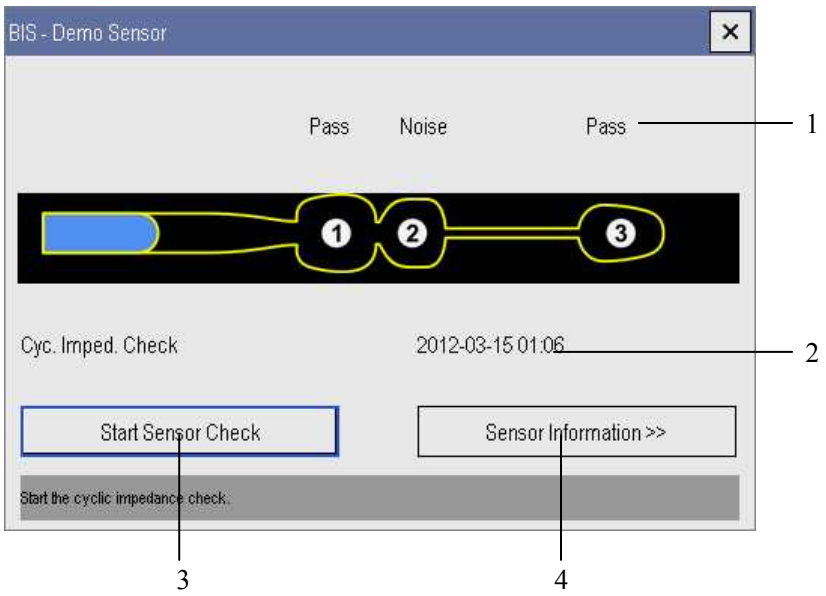
This measures the exact impedance of each individual electrode. It causes a disturbed EEG wave, and a prompt message is displayed on the monitor

- The cyclic impedance check is automatically initiated when a sensor is connected. To manually start a cyclic impedance check manually, you can either:
  - Select [**Cyc Imped. Check**] in the [**BIS Setup**] menu and then select [**On**].
  - Press the  hardkey on the BIS module.
  - Select [**Start Sensor Check**] in the BIS sensor window.

- The cyclic impedance check stops automatically if the impedances of all electrodes are within the valid range. To manually stop a cyclic impedance check, you can either:
  - Select [**Cyc Imped. Check**] in the [**BIS Setup**] menu and then select [**Off**]
  - Press the  hardkey on the BIS module.
  - Select [**Stop Sensor Check**] in the sensor check window.

18.7 BIS Sensor Check Window

To open the sensor check window, select [**Sensor Check** >>] in the [**BIS Setup**] menu. The graphic in the BIS sensor check window automatically adapts to show the type of sensor you are using, show three or four electrodes as required. Each symbol in the graphic represents an electrode and illustrates the most recently-measured impedance status of the electrodes: ① is the reference electrode; ② the ground electrode; ③ and ④ are signal electrodes.



1. Electrode impedance check result
2. Time of the most recent impedance check
3. Start/stop cyclic impedance checks
4. Show sensor information

The measured electrode-to-skin impedance and electrode status are displayed above each electrode:

Status	Description	Action
[**Lead Off**]	Electrode falls off and has no skin contact	Reconnect electrode, or check the sensor-to-skin contact. If necessary, clean and dry skin.
[**Noise**]	The EEG signal is too noisy. Impedance cannot be measured	Check the sensor-to-skin contact. If necessary, clean and dry skin.
[**High**]	The impedance is above the limit	
[**Pass**]	The impedance is within valid range	No action necessary.

Although BIS may still be measured when the electrode status is [**Noise**] or [**High**], for best performance, all electrodes should be in [**Pass**] status.

18.8 Choosing the BIS Smoothing Rate

To change the smoothing rate:

1. Select the BIS parameter window to enter the [**BIS Setup**] menu.
2. Select [**Smoothing Rate**] and then toggle between [**10 s**], [**15 s**] and [**30 s**]

The smoothing rate defines how the monitor averages the BIS value. With the smoothing rate becoming smaller, the monitor provides increased responsiveness to changes in the patient's state. Contrarily, the monitor provides a smoother BIS trend with decreased variability and sensitivity to artifact.

18.9 Setting up the EEG Wave

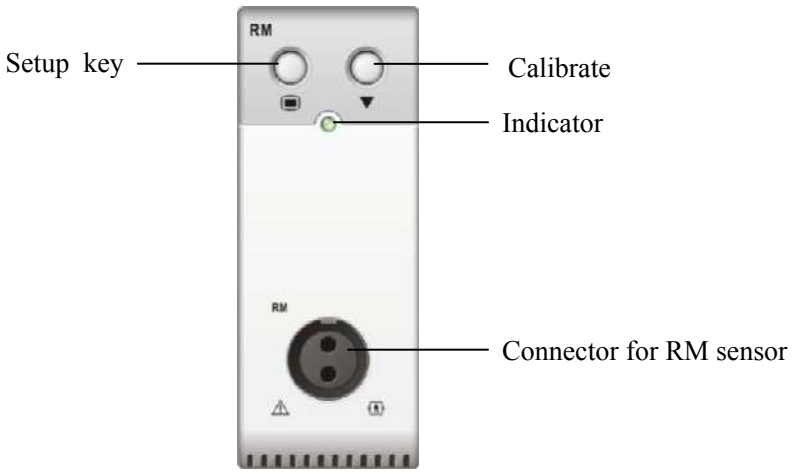
Select the EEG wave to enter the [**BIS EEG Waveform**] menu. In this menu, you can:

- Select [**Scale**] and then select the appropriate setting.
- Select [**Sweep**] and then select the appropriate setting. The faster the wave sweeps, the wider the wave is.

19 Monitoring RM

19.1 Introduction

In the respiratory mechanics measurement, the airway pressures are measured, from the part between the patient circuit and intubation tube, using a flow sensor between the Y-piece of patient circuit and the patient connection. The pressure is transferred to the monitor through the tube and measured by a pressure transducer in the RM module. The pressure difference together with the gas concentration information is used to calculate flow. The volume information is obtained by integrating the flow signal. From these three parameter, other parameter such as RR, I:E, Compl, etc. are derived.



The RM monitoring enables clinicians to understand the ventilator operation and patient respiratory status.

RM monitoring displays the following waveforms and loops:

- Flow waveform
- Paw waveform
- Vol waveform
- FV (flow-volume) loop
- PV (paw-volume) loop

RM monitoring provides values for 18 parameters. The 18 parameters can be classified into 4 categories:

1. Paw parameters
   - PIP: peak inspiratory pressure (unit: cmH_2O)
   - Pplat: plateau pressure (unit:cmH_2O)
   - PEEP: positive end expiratory pressure (unit: cmH_2O)
   - Pmean: mean pressure (unit: cmH_2O)

2. Flow parameters
   - PIF: peak inspiratory flow (unit: L/min)
   - PEF: peak expiratory flow (unit: L/min)

3. Vol parameters
   - TVi: inspiratory tidal volume (unit: ml)
   - TVe: expiratory tidal volume (unit: ml)
   - MVi: inspirator minute volume (L)
   - MVe: expiratory minute volume (L)

4. Other parameters
   - RR: respiratory rate (unit: rpm)
   - I: E: ratio of the inspiratory and expiratory time
   - Compl: compliance (unit: ml/cmH_2O)
   - Raw: airway resistance (unit: cmH_2O/L/s)
   - FEV1.0%: first second forced expiratory volume ratio (unit: %)
   - RSBI: rapid shallow breathing index (unit: rpm/L)
   - NIP: negative inspiratory pressure (cmH_2O)
   - WOB: work of breathing (J/L)

19.2 Safety Information

⚠WARNING

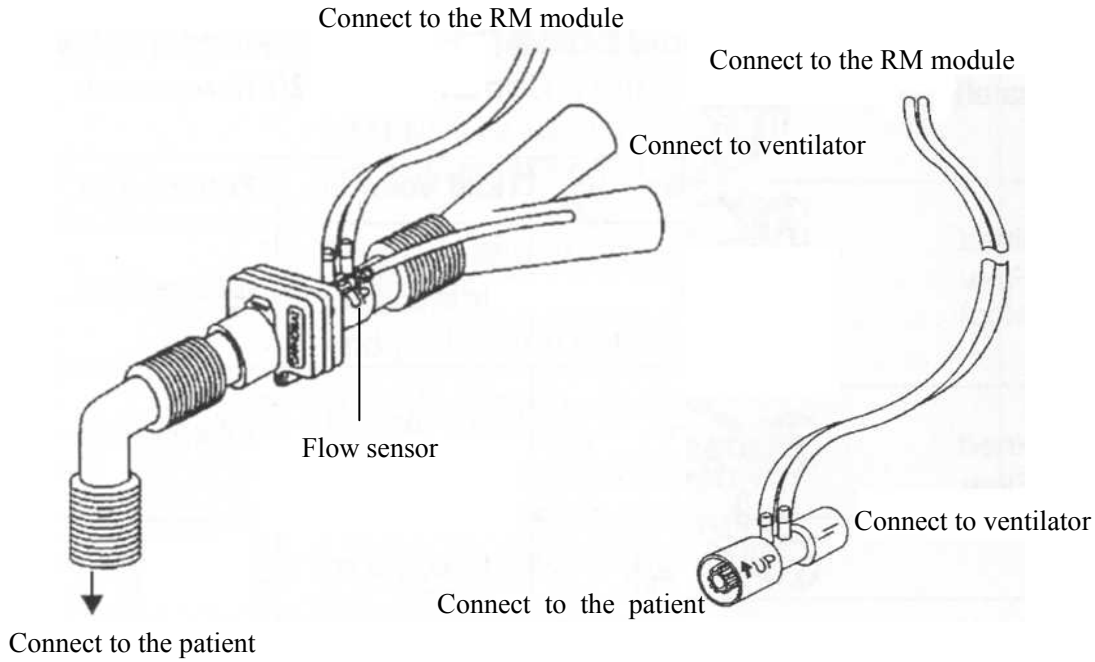
- **Check for leaks in the breathing circuit system, as they may significantly affect respiratory mechanics readings.**
- **Verify the Ventilation Mode. Improper settings of this function will cause incorrect calculations of some parameters.**
- **Match the airway adapter you select to the appropriate patient category. Improper sensor selection may produce excessive ventilation resistance or introduce excessive airway deadspace, as well as inaccurate scales and alarm limits.**
- **Periodically check the flow sensor and tubing for excessive moisture or secretion build-up and purge if necessary.**

NOTE

- **To avoid the affects of excessive moisture in the measurement circuit, insert the flow sensor airway adapter in the breathing circuit with the tubes upright.**
- **Do not place the airway adapter between the endotracheal tube and an elbow as this may allow patient secretions to block the adapter windows.**

19.3 Preparing to Monitor RM

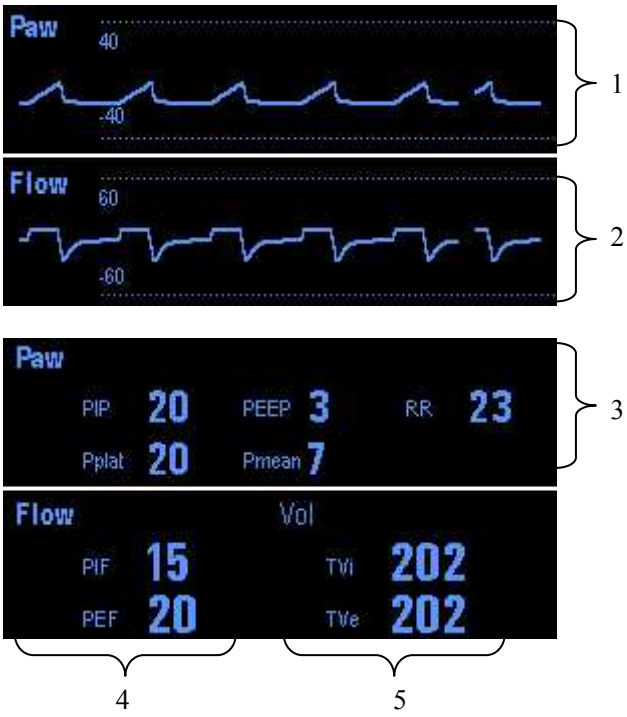
1. Select an appropriate flow sensor in accordance with the patient category.
2. Connect the small tubes of the flow sensor to the RM connector of the module using a color-coded adapter.
3. Insert the flow sensor between the Y-piece of the patient circuit and the patient connection.



4. Select the RM parameter window to open the [**RM Setup**] menu.
5. Select [**Sensor Type**] and then choose either [**Disposable**] or [**Reusable**] according to the selected sensor.
6. Select [**Ventilation Mode**] and then choose either [**Spontaneous**] or [**Mechanical**] according to the patient's ventilation status.

19.4 Understanding the RM Display

The RM display shows either the Paw and Flow waveforms, or the Paw and Vol waveforms in the waveform area.



1. Paw waveform
2. Flow waveform
3. Paw parameter window
4. Flow parameter window
5. Vol parameter window

19.5 Changing RM Settings

19.5.1 Accessing RM Menus

- By selecting the RM parameter window, you can access the [**RM Setup**] menu.
- By selecting the Paw wave, you can access the [**Paw Waveform**] menu.
- By selecting the Flow wave, you can access the [**Flow Waveform**] menu.
- By selecting the Vol wave, you can access the [**Vol Waveform**] menu.

19.5.2 Setting the Apnea Alarm Delay

In the [**RM Setup**] menu, select [**Apnea Time**] and then select the appropriate setting. The monitor will alarm if the patient has stopped breathing for longer than the preset apnea time.

⚠WARNING

- **The respiration measurement does not recognize the cause of apneas. It only indicates an alarm if no breath is detected when a pre-adjusted time has elapsed since the last detected breath. Therefore, it cannot be used for diagnostic purpose.**

19.5.3 Selecting TV or MV for Display

To select tidal volume (TV) or minute volume (MV) for display in the Vol parameter window, in the [**RM Setup**] menu, select [**TV/MV**] and toggle between [**TV**] and [**MV**]. By default, the Vol parameter window displays TV values.

19.5.4 Selecting Flow or Vol Waveform for Display

To select Flow or Vol waveform for display:

1. Select the currently displayed Flow or Vol waveform to enter its waveform menu.
2. Select [**Flow/Vol**] and toggle between [**Flow**] and [**Vol**].

19.5.5 Changing the Wave Sweep Speed

1. Select your desired waveform to enter its waveform menu.
2. Select [**Sweep**] and select the appropriate setting. The faster the wave sweeps, the wider the wave is.

19.5.6 Changing the Wave Scale

The wave scale changes automatically if [**Scaling**] is set to [**Auto**].

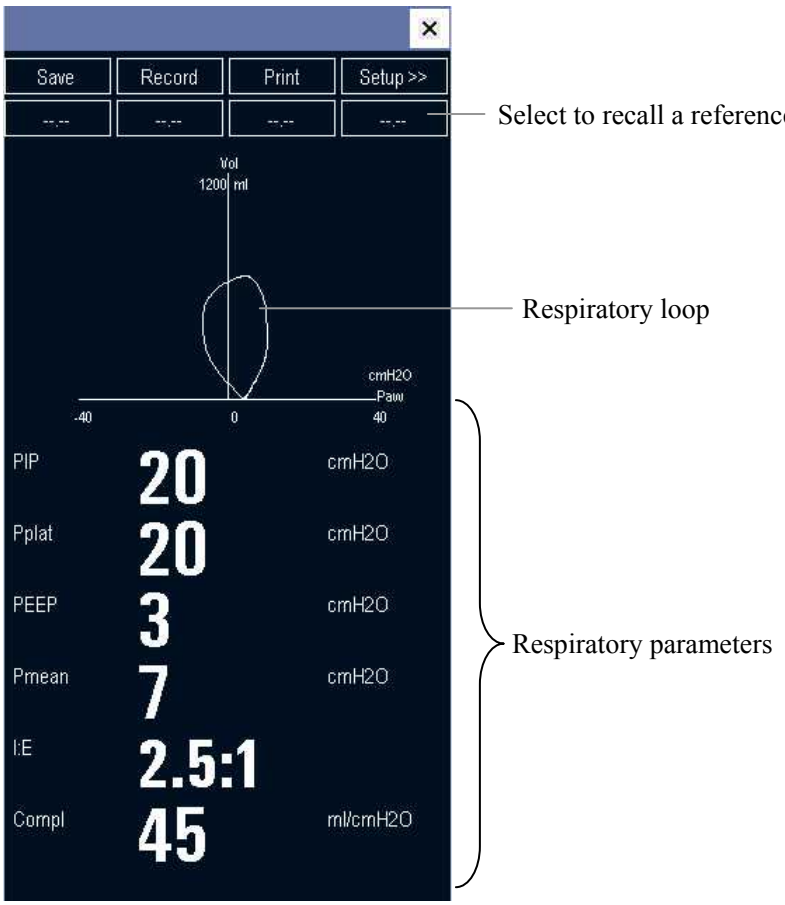
1. Select your desired waveform to enter its waveform menu.
2. Select [**Scaling**] and then select [**Auto**].

To manually adjust the wave scale (take the Paw wave for example):

1. Select the Paw waveform to enter the [**Paw Waveform**] menu.
2. Select [**Scaling**] and then select [**Manual**].
3. Select [**Paw Scale**] and then select the appropriate setting.

19.6 Understanding the Respiratory Loops

Select [**Respiratory Loop**] in the [**RM Setup**] menu. The following window will be displayed.



In this window, you can:

- Select [**Save**] to save the respiratory loops in the current respiratory cycle as the reference loops. Up to 4 groups of respiratory loops can be saved, and the saving time is displayed above the respiratory loops.
- Change the respiratory loops displayed on the screen: select [**Setup >>**]→[**Display Loop**] and then toggle between [**PV Loop**] and [**FV Loop**].
- Turn on/off reference loop: select [**Setup >>**]→[**Reference Loop**], and then toggle between [**On**] and [**Off**].
- Change the size of the PV and FV loops: select [**Setup >>**]→[**Scaling**]→[**Manual**] and then adjust the [**Paw Scale**], [**Vol Scale**] or [**Flow Scale**]. You can also set [**Scaling**] to [**Auto**]. The scaling of the parameters is automatically adjusted to suit the patient's respiratory condition.

- Select parameters for display: select [**Setup >>**]→[**Select RM Parameters >>**], and then select [**All RM Parameters**] or [**Select Desired RM Parameters**]. When you select [**Select Desired RM Parameters**], 6 parameters at maximum can be selected.
- Print out all parameters for a reference loop by selecting your desired reference loop and then selecting [**Record**].

19.7 Zeroing the RM Module

A zero calibration is carried out automatically every time when the patient monitor is switched on or the RM module connected, and then a zero calibration will automatically be triggered at a specific interval. Then, a zero calibration is triggered every 30 minutes. You can also start a manual zero calibration when there is a drift in the zero: in the [**RM Setup**] menu, select [**Zero RM**].

19.8 Calibrating the Flow Sensor

A calibration must be performed every time when the flow sensor is changed.

1. In the [**RM Setup**] menu, select [**Calibrate RM >>**].
2. Enter the positive factor provided on the flow sensor and select [**Calibrate**].
3. Enter the negative factor provided on the flow sensor and select [**Calibrate**].
4. After the calibration is completed successfully, the last calibration time and the message [**Calibration Completed!**] are displayed. Otherwise, the message [**Calibration Failed!**] is displayed.

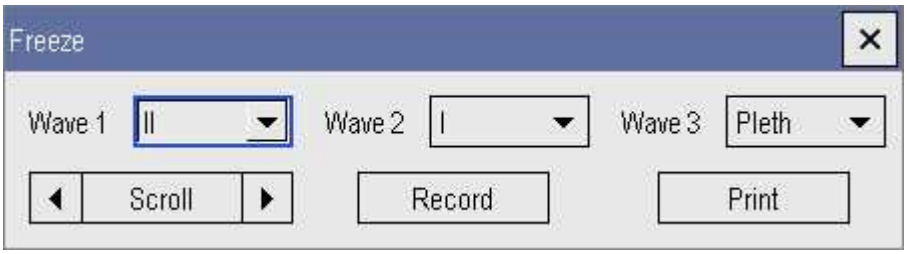
FOR YOUR NOTES

20 Freezing Waveforms

During patient monitoring, the freeze feature allows you to freeze the currently displayed waveforms on the screen so that you can have a close examination of the patient's status. Besides, you can select any frozen waveform for recording.

20.1 Freezing Waveforms

1. To freeze waveforms, select the hardkey on the monitor's front, or the on-screen QuickKey.
2. The system closes the displayed menu (if any), and opens the [**Freeze**] menu.



3. All displayed waveforms are frozen, i.e. the waveforms stop being refreshed or scrolling.

The freeze feature exerts no effect on the split-screen view of minitrends, oxyCRG and other patients.

20.2 Viewing Frozen Waveforms

To view the frozen waveforms, you can either:

- Select the [**Scroll**] button and then rotate the Knob clockwise or counter-clockwise, or
- Directly select the or beside the [**Scroll**] button using a mouse or through the touchscreen.

At the lower right corner of the bottommost waveform, there is an upward arrow. The frozen time is displayed below the arrow. With each step or click, the frozen time changes at intervals of 1 second.

20.3 Unfreezing Waveforms

To unfreeze the frozen waveforms, you can either:

- Select the button at the upper right corner of the [**Freeze**] menu,
- Select the hardkey on the monitor's front, or
- Perform any other action that causes the screen to be readjusted or opens a menu, such as plugging in or out a module, pressing the hardkey, etc.

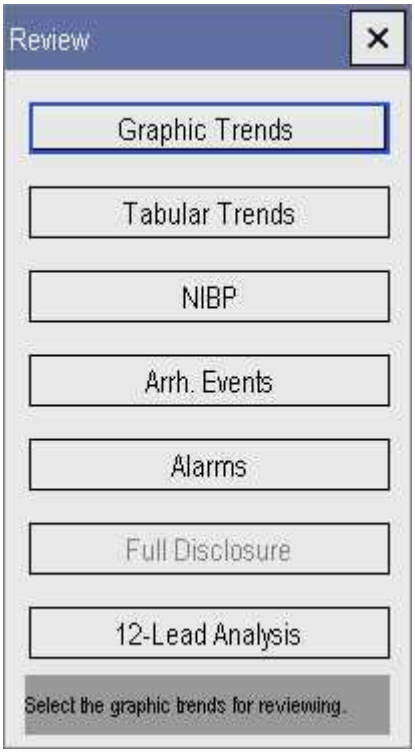
20.4 Recording Frozen Waveforms

1. In the [**Freeze**] menu, select, in turn, [**Wave 1**], [**Wave 2**] and [**Wave 3**] and then select your desired waveforms.
2. Select the [**Record**] button. The selected waveforms and all numerics at the frozen time are printed out by the recorder.

21 Review

21.1 Accessing Respective Review Windows

1. Select the [**Review**] QuickKey, or [**Main Menu**]→[**Review >>**].

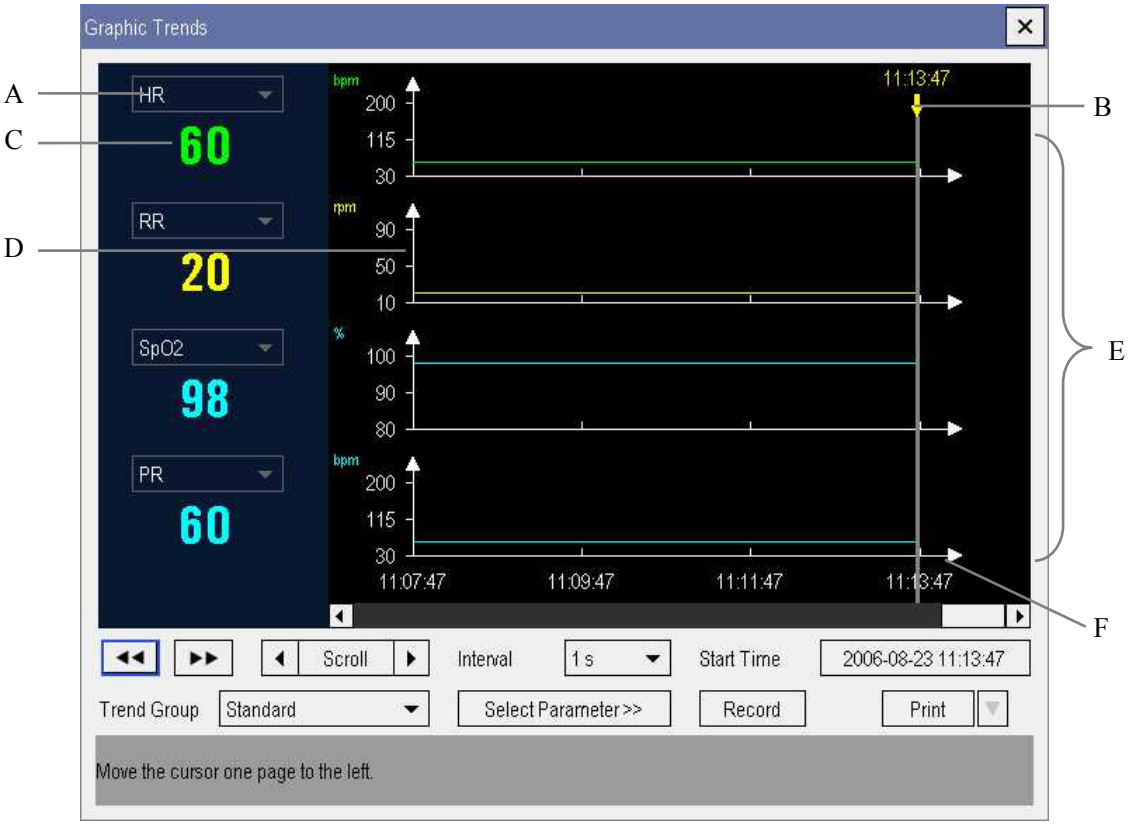


2. Select [**Graphic Trends**], [**Tabular Trends**], [**NIBP**], [**Arrh. Events**], [**Alarms**], [**Full Disclosure**] or [**12-Lead Analysis**] to access their respective review windows.

For details about reviewing arrhythmia events and 12-lead analysis results, refer to the chapter ***7 Monitoring ECG***.

21.2 Reviewing Graphic Trends

In the [**Review**] menu, select [**Graphic Trends**] to access the following window.



A. Parameter combo box B. Slider C. Parameter value

D. Parameter scale E. Graphic trends F. Time axis

In this review window:

- To select parameters for viewing, you can either:
  - Select respective parameter combo boxes and then select your desired parameters, or
  - Select [**Trend Group**] and then select a group from the popup list, or
  - Select [**Select Parameter**>>] and then select your desired parameters from the popup menu.

- You can set the start time of the trends you want to view by selecting [**Start Time**].

- You can change the resolution of the trend data by selecting [**Interval**] and then selecting the appropriate setting:
  - [**1 s**]: select to view up to 1 hour of graphic trends at 1-second resolution.
  - [**5 s**]: select to view up to 8 hours of graphic trends at 5-second resolution.
  - [**1 min**], [**5 min**] or [**10 min**]: select to view up to 120 hours of graphic trends at 1-, 5-, or 10-minute resolution.

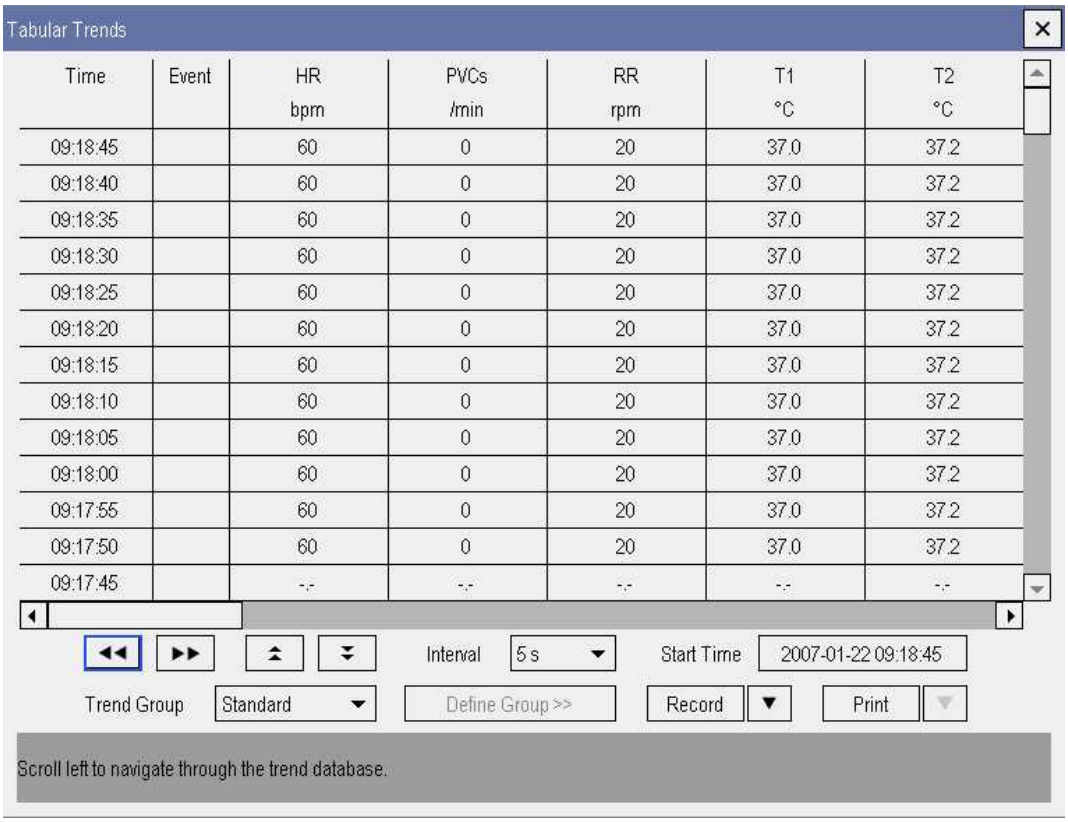
- To browse the graphic trends, you can either:
  - Select ◀ or ▶ to move the cursor one step to the left or right to navigate through the graphic trends, or
  - Select ◀◀ or ▶▶ to move the cursor one page to the left or right to navigate through the graphic trends.

  A time indicating your current position is displayed above the cursor. Numeric measurement values corresponding to the cursor location appear in the left side of the [**Graphic Trends**] window, and change as the cursor is moved.

- By selecting the [**Record**] button, you can print out the currently displayed graphic trends by the recorder.
- By selecting the [**Print**] button, you can print out the currently displayed graphic trends by the printer.

21.3 Reviewing Tabular Trends

In the [**Review**] menu, select [**Tabular Trends**] to access the following window.



In this review window:

- To select parameters for viewing, you can either:
  - Select [**Trend Group**] and then select a group from the popup list, or
  - Select the [**Define Group**>>] button and then select the parameters you want to view from the popup menu.

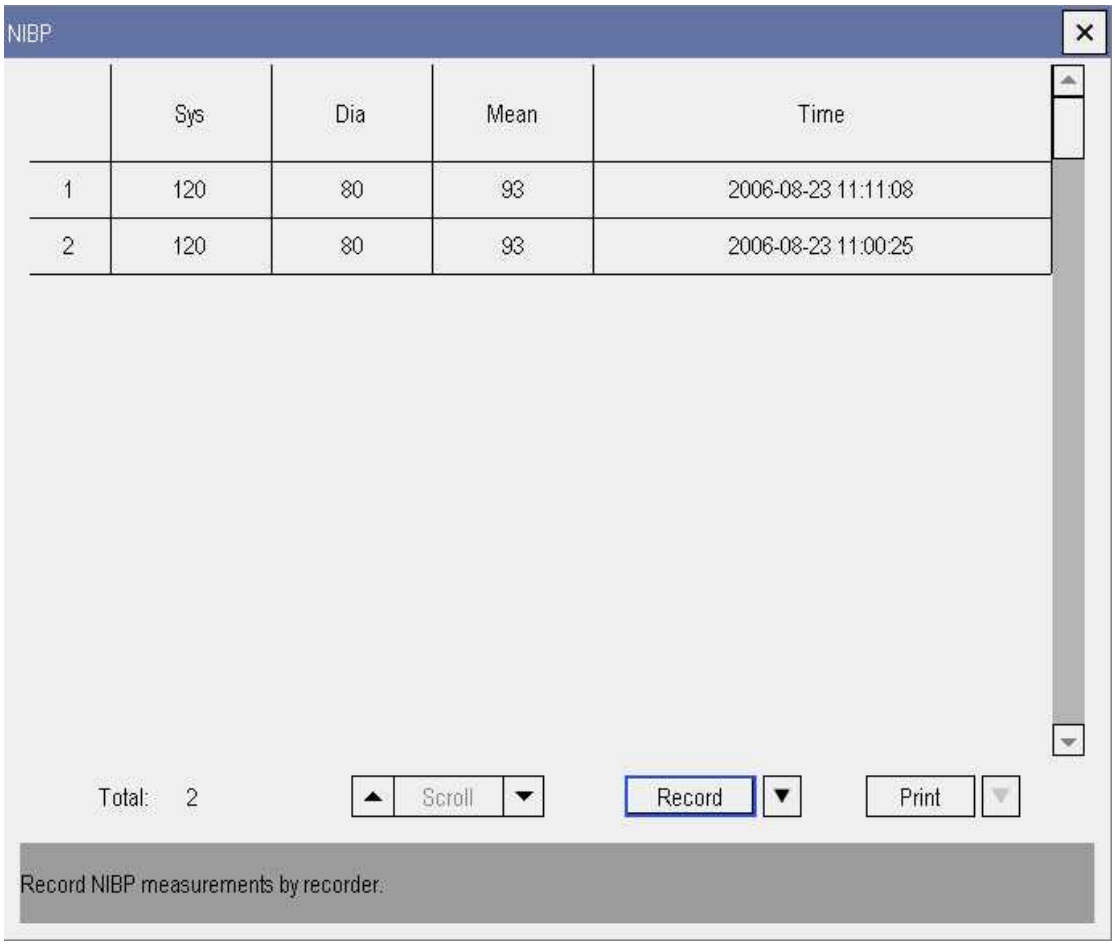
- You can set the start time of the trends you want to view by selecting [**Start Time**].
- You can change the resolution of the trend data by selecting [**Interval**] and then selecting the appropriate setting:
  - [**5 s**] or [**30 s**]: select to view up to 8 hours of tabular trends at 5- or 30-second resolution.
  - [**1 min**], [**5 min**], [**10 min**], [**30 min**] or [**1 h**]: select to view up to 120 hours of tabular trends at your selected resolution.

- To browse the tabular trends, you can either:
  - Select ◀ or ▶ beside the horizontal scrollbar to drag the scrollbar left or right to navigate through the trend database, or
  - Select ◀◀ or ▶▶ to scroll left or right to navigate through the trend database.
  - Select ▲ or ▼ beside the vertical scrollbar to drag the scrollbar up or down to view more measurement values, or
  - Select ⏫ or ⏬ to scroll up or down to view more measurement values.

- By selecting the [**Record**] button, you can print out the currently displayed tabular trends by the recorder.
- By selecting ▼ beside the [**Record**] button, you can access the [**Record Setup**] menu and set the start and end time of the tabular trends you want to record. This feature is not available when reviewing a history patient.
- By selecting the [**Print**] button, you can print out the currently displayed tabular trends by the printer.

21.4 Reviewing NIBP Measurements

In the [**Review**] menu, select [**NIBP**] to access the following window. This window displays systolic pressure, diastolic pressure, mean pressure, and time for each measurement. Besides, the total number of measurements is displayed at the lower left corner.

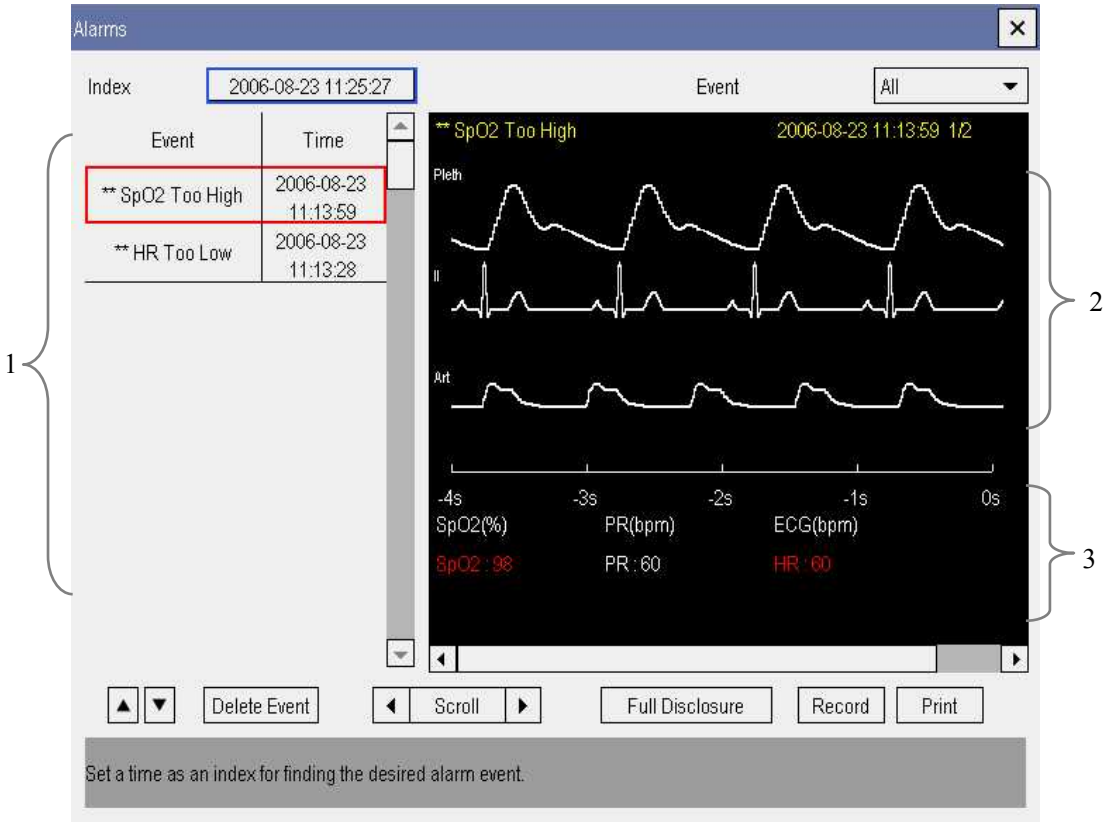


In this review window:

- Up to 10 measurements can be displayed at a time. You can select or beside the [**Scroll**] button to view more measurements.
- By selecting the [**Record**] button, you can print out the currently displayed NIBP measurements by the recorder.
- By selecting beside the [**Record**] button, you can access the [**Record Setup**] menu and set the start and end time of NIBP measurements you want to record. This feature is not available when reviewing a history patient.
- By selecting the [**Print**] button, you can print out the currently displayed NIBP measurements by the printer.

21.5 Reviewing Alarms

When a measurement alarm occurs, all relative measurement numerics at the alarm trigger time and related waveforms 2, 4 or 8 seconds respectively before and after the alarm trigger time are stored. To review the stored alarms, select [**Review**]→[**Alarms**] to access the following window.



1. Event list 2. Waveform area 3. Parameter area

In this review window:

- You can set a time as the index for finding your desired alarm event. If you set a time that is too early, the earliest alarm event will be recalled. If you set a time that is too late, the last alarm event will be recalled.
- You can view the desired measurement alarms by selecting [**Event**] and then selecting the measurement whose alarms you want to view. [**All**] includes all measurements.
- To select an alarm event for viewing, you can either:
  - Select the or button, or
  - Directly select your desired alarm event on the screen.

- As soon as an alarm event is selected, its measurement numerics and related waveforms are displayed respectively in the parameter and waveform area.
- You can select  or  to navigate through the waveforms.
- By selecting the [**Record**] button, you can print out the currently displayed alarm events by the recorder.
- By selecting the [**Print**] button, you can print out the currently displayed alarm events by the printer.
- You can select [**Full Disclosure**] to access the waveform review window. However, if you do not save waveforms beforehand, the message [**Searching Data Failed!**] will be displayed.

21.6 Reviewing Waveforms

In the [**Review**] menu, select [**Full Disclosure**] to access the following window.

1. Parameter combo box 2. Slider 3. Parameter value

4. Full-disclosure waveform 5. Time axis

In this review window:

- To review full-disclosure waveforms, you need to save waveforms first. Select [**Save Waves >>**] and then select the parameters whose waveforms you want to view. To save full-disclosure waveform, your monitor must be equipped with a CF storage card.
- You can set the start time of the waveforms you want to view by selecting [**Start Time**] and then selecting the appropriate settings.
- You can select a waveform you want to view from either parameter combo box.

- To view the waveforms, you can either:
  - Select ◀ or ▶ beside the [**Scroll**] button to move the cursor one step left or right to navigate through the waveforms, or
  - Select ◀◀ or ▶▶ to move the cursor one page left or right to navigate through the waveforms.

  A time indicating your current position is displayed above the cursor. Numeric measurement values corresponding to the cursor location are displayed in the left side of the [**Waveforms**] window, and change as the cursor is moved.
- You can change the wave gain by selecting [**Gain**] and then selecting the appropriate setting. The number of waveforms displayed in this window is subject to the wave gain.
- You can change the waveform sweep speed by selecting [**Sweep**] and then selecting the appropriate setting.
- By selecting the [**Record**] button, you can print out the first three waveforms and measurement numerics by the recorder.
- By selecting the [**Print**] button, you can print out the waveforms and measurement numerics by the printer.

22 Calculations

22.1 Introduction

The calculation feature is available with your patient monitor. The calculated values, which are not directly measured, are computed based on the values you provide.

Your can perform the following calculations:

- Dose calculations
- Oxygenation calculations
- Ventilation calculations
- Hemodynamic calculations
- Renal calculations

To perform a calculation, select [**Main Menu**] → [**Calculations >>**], or the [**Calculations**] QuickKey and then select the calculation you want to perform.

NOTE

- **The calculation feature is independent of other monitoring functions and can be therefore used for patients being monitored by other monitors. Any operation in a calculation window does not affect the patient monitoring by the local patient monitor.**

⚠ WARNING

- **After the calculation is finished, verify the entered values are correct and the calculated values are appropriate. We assume no responsibility for any consequences caused by wrong entries and improper operations.**

22.2 Dose Calculations

22.2.1 Performing Calculations

To perform a dose calculation:

1. Select [**Main Menu**]→[**Calculations** >>]→[**Dose** >>], or select [**Calculations**] QuickKey→[**Dose** >>].
2. Select, in turn, [**Patient Cat.**] and [**Drug Name**] and then select the appropriate settings. The dose calculation program has a library of commonly used drugs, of which Drug A through Drug E are for those not specified in this library.
   - ◆ Drug A, B, C, D, E
   - ◆ Aminophylline
   - ◆ Dobutamine
   - ◆ Dopamine
   - ◆ Epinephrine
   - ◆ Heparin
   - ◆ Isuprel
   - ◆ Lidocaine
   - ◆ Nipride
   - ◆ NItroglycerin
   - ◆ Pitocin
3. The system gives a set of default values when the above steps are finished. However, these values cannot be used as the calculated values. The user must enter values following the doctor’s instructions, and then the calculated values can only be used
4. Enter the patient’s weight.
5. Enter other values.
6. Verify if the calculated values are correct.

22.2.2 Selecting the Proper Drug Unit

Each drug has its fixed unit or unit series. Among a unit series, one unit may change to another automatically depending on the entered value.

The units for each drug are as follows:

- Drug A, B, C, Aminophylline, Dobutamine, Dopamine, Epinephrine, Isuprel, Lidocaine, Nipride and NItroglycerin use the unit series: g, mg and mcg.
- Drug D, Heparin and Pitocin use the unit series: Unit, KU (kilo units) and MU (million units).
- Drug E uses the unit: mEq (milli-equivalents).

You must select the proper drug name (A, B, C, D or E) according to the units when you define a drug not listed in this library.

NOTE

- **For neonate patients, [Drip Rate] and [Drop Size] are disabled.**

22.2.3 Titration Table

To open the titration table, select [**Titration Table >>**] in the [**Dose Calculation**] window after the dose calculation is finished.

In the titration table, when you change:

- [**Reference**]
- [**Interval**]
- [**Dose Type**]

The titrated values change accordingly.

You can also:

- Select  or  , or  or  beside the vertical scrollbar to view more values.
- Select [**Record**] to print out the currently displayed titrated values by the recorder.

22.3 Oxygenation Calculations

22.3.1 Performing Calculations

To perform an oxygenation calculation:

1. Select [**Main Menu**]→[**Calculations** >>]→[**Oxygenation** >>], or select [**Calculations**] QuickKey→[**Oxygenation** >>].
2. Enter values for calculation.
3. Select the [**Calculate**] button. The system performs a calculation per the current settings and displays the calculated values.
   - ◆ If a calculated value is outside the range, its background will highlight in yellow. You can select [**Range**] to view its normal range in the unit field. For those who are within the range, their unit fields appear blank.
   - ◆ Invalid values are displayed as [---].

In the [**Oxygenation Calculation**] window, you can:

- ■ Change the pressure unit, Hb unit and oxygen content unit by selecting [**Press. Unit**], [**Hb Unit**] and [**OxyCont Unit**] and then selecting the appropriate settings. The changes take effect automatically.
- ■ Trigger a recording by selecting the [**Record**] button. The currently displayed oxygenation calculations are printed out by the recorder.
- ■ Review the previously performed calculations by selecting [**Review**].

22.3.2 Entered Parameters

Abbreviation	Unit	Full spelling
C.O.	L/min	cardiac output
FiO2	%	percentage fraction of inspired oxygen
PaO2	mmHg	partial pressure of oxygen in the arteries
PaCO2	mmHg	partial pressure of carbon dioxide in the arteries
SaO2	%	arterial oxygen saturation
PvO2	mmHg	partial pressure of oxygen in venous blood
SvO2	%	venous oxygen saturation
Hb	g/L	hemoglobin
CaO2	ml/L	arterial oxygen content
CvO2	ml/L	venous oxygen content
VO2	ml/min	oxygen consumption
RQ	None	respiratory quotient
ATMP	mmHg	atmospheric pressure
Height	cm	height
Weight	kg	weight

22.3.3 Calculated Parameters

Abbreviation	Unit	Full spelling
BSA	m^2	body surface area
VO2 calc	ml/min	oxygen consumption
C(a-v)O2	ml/L	arteriovenous oxygen content difference
O2ER	%	oxygen extraction ratio
DO2	ml/min	oxygen transport
PAO2	mmHg	partial pressure of oxygen in the alveoli
AaDO2	mmHg	alveolar-arterial oxygen difference
CcO2	ml/L	capillary oxygen content
Qs/Qt	%	venous admixture
C.O. calc	L/min	calculated cardiac output

22.4 Ventilation Calculations

22.4.1 Performing Calculations

To perform a ventilation calculation:

1. Select [**Main Menu**]→[**Calculations** >>]→[**Ventilation** >>], or select [**Calculations**] QuickKey→[**Ventilation** >>].
2. Enter values for calculation.
3. Select the [**Calculate**] button. The system performs a calculation per the current settings and displays the calculated values.
   - ◆ If a calculated value is outside the range, its background will highlight in yellow. You can select [**Range**] to view its normal range in the unit field. For those who are within the range, their unit fields appear blank.
   - ◆ Invalid values are displayed as [---].

In the [**Ventilation Calculation**] window, you can:

- ■ Change the pressure unit by selecting [**Press. Unit**] and then selecting the appropriate setting. Corresponding pressure values shall convert and update automatically.
- ■ Trigger a recording by selecting the [**Record**] button. The currently displayed ventilation calculations are printed out by the recorder.
- ■ Review the previously performed calculations by selecting [**Review**].

22.4.2 Entered Parameters

Abbreviation	Unit	Full spelling
FiO2	%	percentage fraction of inspired oxygen
RR	rpm	respiration rate
PeCO2	mmHg	partial pressure of mixed expiratory CO2
PaCO2	mmHg	partial pressure of carbon dioxide in the arteries
PaO2	mmHg	partial pressure of oxygen in the arteries
TV	ml	tidal volume
RQ	None	respiratory quotient
ATMP	mmHg	atmospheric pressure

22.4.3 Calculated Parameters

Abbreviation	Unit	Full spelling
PAO2	mmHg	partial pressure of oxygen in the alveoli
AaDO2	mmHg	alveolar-arterial oxygen difference
Pa/FiO2	mmHg	oxygenation ratio
a/AO2	%	arterial to alveolar oxygen ratio
MV	L/min	minute volume
Vd	ml	volume of physiological dead space
Vd/Vt	%	physiologic dead space in percent of tidal volume
VA	L/min	alveolar volume

22.5 Hemodynamic Calculations

22.5.1 Performing Calculations

To perform a hemodynamic calculation:

1. Select [**Main Menu**]→[**Calculations** >>]→[**Hemodynamic** >>], or select [**Calculations**] QuickKey→[**Hemodynamic** >>].
2. Enter values for calculation.
   - ◆ For a patient who is being monitored, [**HR**], [**Art mean**], [**PA mean**] and [**CVP**] are automatically taken from the currently measured values. If you just have performed C.O. measurements, [**C.O.**] is the average of multiple thermodilution measurements. [**Height**] and [**Weight**] are the patient's height and weight you have entered. If the monitor does not provide these values, their fields appear blank.
   - ◆ For a patient who is not being monitored, confirm the values you have entered.
3. Select the [**Calculate**] button. The system performs a calculation per the current settings and displays the calculated values.
   - ◆ If a calculated value is outside the range, its background will highlight in yellow. You can select [**Range**] to view its normal range in the unit field. For those who are within the range, their unit fields appear blank.
   - ◆ Invalid values are displayed as [---].

In the [**Hemodynamic Calculation**] window, you can:

- ■ Trigger a recording by selecting the [**Record**] button. The currently displayed renal calculations are printed out by the recorder.
- ■ Review the previously performed calculations by selecting [**Review**].

22.5.2 Entered Parameters

Abbreviation	Unit	Full spelling
C.O.	L/min	cardiac output
HR	bpm	heart rate
PAWP	mmHg	pulmonary artery wedge pressure
Art Mean	mmHg	artery mean pressure
PA Mean	mmHg	pulmonary artery mean pressure
CVP	mmHg	central venous pressure
EDV	ml	end-diastolic volume
Height	cm	height
Weight	kg	weight

22.5.3 Calculated Parameters

Abbreviation	Unit	Full spelling
BSA	m^2	body surface area
C.I.	$L/min/m^2$	cardiac index
SV	ml	stroke volume
SI	ml/m^2	stroke index
SVR	DS/cm^5	systemic vascular resistance
SVRI	$DS \cdot m^2/cm^5$	systemic vascular resistance index
PVR	DS/cm^5	pulmonary vascular resistance
PVRI	$DS \cdot m^2/cm^5$	pulmonary vascular resistance index
LCW	kg·m	left cardiac work
LCWI	$kg \cdot m/m^2$	left cardiac work index
LVSW	g·m	left ventricular stroke work
LVSWI	$g \cdot m/m^2$	left ventricular stroke work index
RCW	kg·m	right cardiac work
RCWI	$kg \cdot m/m^2$	right cardiac work index
RVSW	g·m	right ventricular stroke work
RVSWI	$g \cdot m/m^2$	right ventricular stroke work index
EF	%	ejection fraction

22.6 Renal Calculations

22.6.1 Performing Calculations

To perform a renal calculation:

1. Selecting [**Main Menu**]→[**Calculations** >>]→[**Renal** >>], or select [**Calculations**] QuickKey→[**Renal** >>].
2. Enter values for calculation.
3. Select the [**Calculate**] button. The system performs a calculation per the current settings and displays the calculated values.
   - ◆ If a calculated value is outside the range, its background will highlight in yellow. You can select [**Range**] to view its normal range in the unit field. For those who are within the range, their unit fields appear blank.
   - ◆ Invalid values are displayed as [---].

In the [**Renal Calculation**] window, you can:

- ■ Trigger a recording by selecting the [**Record**] button. The currently displayed renal calculations are printed out by the recorder.
- ■ Review the previously performed calculations by selecting [**Review**].

22.6.2 Entered Parameters

Abbreviation	Unit	Full spelling
URK	mmol/L	urine pstassium
URNa	mmol/L	urinary sodium
Urine	ml/24h	urine
Posm	mOsm/ kgH2O	plasm osmolality
Uosm	mOsm/ kgH2O	urine osmolality
SerNa	mmol/L	serum sodium
Cr	μmol/L	creatinine
UCr	μmol/L	urine creatinine
BUN	mmol/L	blood urea nitrogen
Height	cm	height
Weight	kg	weight

22.6.3 Calculated Parameters

Abbreviation	Unit	Full spelling
URNaEx	mmol/24h	urine sodium excretion
URKEx	mmol/24h	urine potassium excretion
Na/K	%	sodium potassium ratio
CNa	ml/24h	clearance of sodium
Clcr	ml/min	creatinine clearance rate
FENa	%	fractional excretion of sodium
Cosm	ml/min	osmolar clearance
CH2O	ml/h	free water clearance
U/P osm	None	urine to plasma osmolality ratio
BUN/Cr	None*	blood urea nitrogen creatinine ratio
U/Cr	None	urine-serum creatinine ratio

*: BUN/Cr is a ratio under the unit of mol.

22.7 Understanding the Review Window

With the review feature, you can review oxygenation, ventilation, hemodynamic and renal calculations. The review window for each calculation is similar. Take the hemodynamic calculations review window for example, you can access it by selecting [**Review**] in the [**Hemodynamic Calculation**] window.

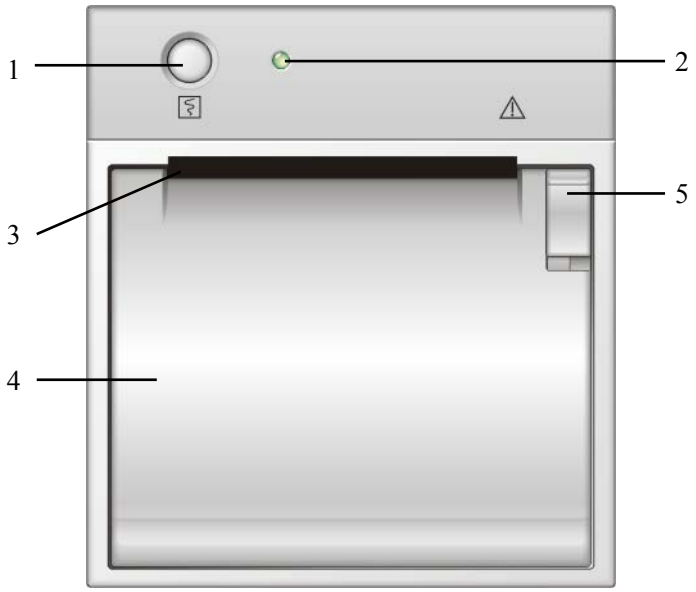
In this review window:

- You can select , , or to view more values.
- The values that exceed the range are displayed in yellow background. The [**Unit**] field displays parameter units. If some parameter values are outside of their normal ranges, you can view their normal range in the [**Unit**] field by selecting [**Range**].
- You can review an individual calculation by selecting its corresponding column and then selecting [**Original Calc**]. You can record the currently displayed calculations or perform another calculation is this window.

23 Recording

23.1 Using a Recorder

The thermal recorder records patient information, measurement numerics, up to three waveforms, etc.



1. Start/Stop key: press to start a recording or stop the current recording.
2. Indicator
   - On: when the recorder works correctly.
   - Off: when the monitor is switched off.
   - Flashes: if an error occurred to the recorder, e.g., the recorder runs out of paper.
3. Paper outlet
4. Recorder door
5. Latch

23.2 Overview of Recording Types

By the way recordings are triggered, the recordings can be classified into the following categories:

- Manually-triggered realtime recordings.
- Timed recordings.
- Alarm recordings triggered by an alarm limit violation or an arrhythmia event.
- Manually-triggered, task-related recordings.

The task-related recordings include:

- Frozen wave recording
- Graphic trends recording
- Tabular trends recording
- NIBP review recording
- Parameter alarm recording
- Arrh. alarm recording
- Wave review recording
- 12-Lead analysis result recording
- Titration table recording
- Hemodynamic calculations recording
- Oxygenation calculations recording
- Ventilation calculations recording
- Renal calculations recording
- oxyCRG recording
- C.O. curve recording
- Respiratory loops recording
- Monitor information recording

NOTE

- **For details about alarm recording, refer to the chapter** *6 Alarms***.**
- **For details about task-related recordings, refer to respective sections of this manual.**

23.3 Starting and Stopping Recordings

To manually start a recording, you can either:

- Select the hardkey on the front of either the patient monitor or the recorder module, or
- Select the on-screen [**Record**] QuickKey, or
- Select the [**Record**] button from the current menu or window.

Automatic recordings will be triggered in the following conditions:

- Timed recordings will start automatically at preset intervals.
- If both [**Alarm**] and [**Alm Rec**] for a measurement are set on, an alarm recording will be triggered automatically as alarms occur.

To manually stop a recording, you can either:

- Select the hardkey again, or
- Select the on-screen [**Record**] QuickKey again, or
- Select [**Clear All Tasks**] in the [**Record Setup**] menu.

Recordings stop automatically when:

- The runtime is over.
- The recorder runs out of paper.
- When the recorder has an alarm condition.

23.4 Setting up the Recorder

23.4.1 Accessing the Record Setup Menu

By selecting [**Main Menu**]→[**Record Setup** >>], you can access the [**Record Setup**] menu.

23.4.2 Selecting Waveforms for Recording

The recorder can record up to 3 waveforms at a time. You can select, in turn, [**Waveform 1**], [**Waveform 2**] and [**Waveform 3**] in the [**Record Setup**] menu, and then select the waveforms you want. You can also turn off a waveform recording by selecting [**Off**]. These settings are intended for realtime and scheduled recordings.

23.4.3 Setting the Realtime Recording Length

After starting a realtime recording, the recording time depends on your monitor's settings. In the [**Record Setup**] menu, select [**Length**] and toggle between [**8 s**] and [**Continuous**].

- [**8 s**]: record 8-second waveforms from the current moment.
- [**Continuous**]: record the waveforms from the current moment until stopped manually.

23.4.4 Setting the Interval between Timed Recordings

Timed recordings start automatically at preset intervals. Each recording lasts 8 seconds. To set the interval between timed recordings: in the [**Record Setup**] menu, select [**Interval**] and then select the appropriate setting.

23.4.5 Changing the Recording Speed

In the [**Record Setup**] menu, select [**Paper Speed**] and toggle between [**25 mm/s**] and [**50 mm/s**]. This setting is for all recordings containing waveforms.

23.4.6 Switching Gridlines On or Off

In the [**Record Setup**] menu, select [**Gridlines**] and toggle between [**On**] and [**Off**].

- [**On**]: show gridlines when recording waveforms.
- [**Off**]: hide gridlines when recording waveforms.

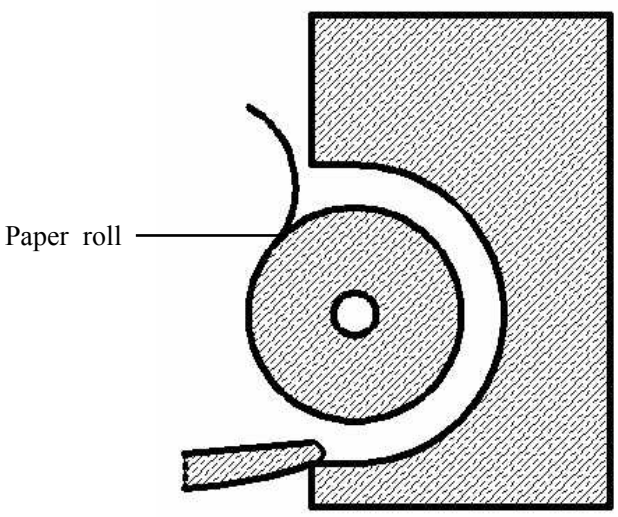
This setting is for all recordings containing waveforms.

23.4.7 Clearing Recording Tasks

In the [**Record Setup**] menu, select [**Clear All Tasks**]. All queued recording tasks are cleared and the current recording is stopped.

23.5 Loading Paper

1. Use the latch at the upper right of the recorder door to pull the door open.
2. Insert a new roll into the compartment as shown below.
3. Close the recorder door.
4. Check if paper is loaded correctly and the paper end is feeding from the top.



⚠CAUTION

- **Use only specified thermal paper. Otherwise, it may cause damage to the recorder's printhead, the recorder may be unable to print, or poor print quality may result.**
- **Never pull the recorder paper with force when a recording is in process. Otherwise, it may cause damage to the recorder.**
- **Do not leave the recorder door open unless you reload paper or remove troubles.**

23.6 Removing Paper Jam

If the recorder works incorrectly or produces unusual sounds, check if there is a paper jam first. If a paper jam is detected, follow this procedure to remove it:

1. Open the recorder door.
2. Take out the paper and tear off the draped part.
3. Reload the paper and close the recorder door.

23.7 Cleaning the Recorder Printhead

If the recorder has been used for a long time, deposits of paper debris may collect on the printhead compromising the print quality and shortening the lifetime of the roller. Follow this procedure to clean the printhead:

1. Take measures against the static electricity such as Disposable Wrist Strap for the work.
2. Open the recorder door and take out the paper.
3. Gently wipe around the printhead using cotton swabs dampened with alcohol.
4. After the alcohol has completely been dried, reload the paper and close the recorder door.

⚠CAUTION

- **Do not use anything that may destroy the thermal element.**
- **Do not add unnecessary force to the thermal head.**

FOR YOUR NOTES

24 Printing

24.1 Printer

The monitor can output patient reports via a connected printer. So far, the monitor supports the following printer:

- HP LaserJet 1320n

The specifications of the reports the monitor prints are:

- Paper: A4, Letter
- Resolution: 300 dpi
- Print on One/Both Sides : printing on one and both sides are supported if the printer supports

For more details about the printer, see the document accompanying the printer. With the upgrading of products, the monitor will support more printers and no prior notice will be given. If you have any doubt about the printer you have purchased, contact our company.

24.2 Setting Up the Printer

To set the printer's properties, select [**Main Menu**]→[**Print Setup >>**]→[**Printer Setup >>**]. In the [**Printer Setup**] menu, you can:

- Select a connected printer

  Select [**Printer**] and then select a connected printer as the monitor's printer.

- Search for a printer

  If your selected printer is not int the list or a new printer is added into the network, you can select the [**Search Printer**] to re-search for all printers in the network..

- Set up the paper

  Select [**Paper Size**] and toggle between [**A4**] and [**Letter**].

- Print on both sides

  By default, the monitor prints out patient reports on one side. If you set [**Print On Both Sides**] to [**On**], the monitor will print out patient reports on both sides.

24.3 Starting Reports Printouts

Reports	Contents	Procedures
ECG reports	ECG waveforms and relevant parameter values	Select [**Main Menu**]→[**Print Setup >>**]→[**ECG Reports >>**]→[**Print**]
Tabular trends	Depend on the selected parameter group, resolution and time period	Select [**Main Menu**]→[**Print Setup >>**]→[**Tabular Trends Reports >>**]→[**Print**], or select [**Main Menu**]→[**Review >>**]→[**Tabular Trends**]→[**Print**]→[**Print**]
Graphic trends	Depend on the selected parameter group, resolution and time period	Select [**Main Menu**]→[**Print Setup >>**]→[**Graphic Trends Reports >>**]→[**Print**], or select [**Main Menu**]→[**Review >>**]→[**Graphic Trends**]→[**Print**]→[**Print**]
Arrh. alarm review	ECG waveforms and relevant parameter values	Select [**Print**] in [**Arrh. Events**]
Parameter alarm review	Depend on the selected alarms	Select [**Main Menu**]→[**Review >>**]→[**Alarms**]→[**Print**]
12-lead analysis	12-lead ECG waveforms and analysis results	Select [**12-Lead Analysis**]→[**Print Report**] when a 12-lead analysis is completed, or select [**Main Menu**]→[**Review >>**]→[**12-Lead Analysis**]→[**Print**]
Realtime waves	Depend on the selected waveforms	Select [**Main Menu**]→[**Print Setup >>**]→[**Realtime Reports >>**]→[**Print**]

24.4 Stopping Reports Printouts

To stop report printouts, select [**Main Menu**]→[**Print Setup >>**]→[**Stop All Reports**].

24.5 Setting Up Reports

24.5.1 Setting Up ECG Reports

You can print out ECG reports only under full-screen, half-screen or 12-lead monitoring screen. To set up ECG reports, select [**Main Menu**]→[**Print Setup** >>]→[**ECG Reports** >>].

- [**Amplitude**]: set the amplitude of the ECG waveforms.
- [**Sweep**]: set the wave print speed.
- [**Auto Interval**]: If [**Auto Interval**] is set to [**On**], the system will automatically adjust the space between waveforms to avoid overlapping.
- [**Gridlines**]: choose whether to show gridlines.
- [**12-Lead Format**]: If you select [**12X1**], 12 waveforms will be printed on a paper from top to bottom. If you select [**6X2**], 12 waveforms will be printed from left to right with 6 waveforms on each half part and a rhythm waveform will be printed at the bottommost.

24.5.2 Setting Up Tabular Trends Reports

To set up tabular trends reports, select [**Main Menu**]→[**Print Setup** >>]→[**Tabular Trends Reports** >>].

- Start time : You can set a time period whose trend data will be printed out by setting [**From**] and [**Back**]. For example, if you set [**From**] as 2007-4-2 10:00:00 and [**Back**] as [**2 h**], the outputted data will be from 2007-4-2 08:00:00 to 2007-4-2 10:00:00. In addition, the [**Back**] can be set to either:
  - [**Auto**]: If [**Report Layout**] is set to [**Time Oriented**], the report will printed by time. If [**Report Layout**] is set to [**Parameter Oriented**], the report will be printed by parameters.
  - [**All**]: If you select [**All**], all trend data will be printed out. In this case, it is no need to set [**From**].
- [**Resolution**]: choose the resolution of the tabular trends printed on the report.
- [**Report Layout**]: If you select [**Time Oriented**], the report will be printed by time. If you select [**Parameter Oriented**], the report will be printed by parameters.
- [**Select Parameter** >>]: from the popup menu, you can:

- [**Currently Displayed Trended Parameters**]: print the parameter trend data selected from the [**Tabular Trends**].
- [**Standard Parameter Group**]: select the standard parameter group for printing.
- [**Custom**]: You can define a parameter group for printing from the parameters displayed in the low part of the menu.

24.5.3 Setting Up Graphic Trends Reports

To set up graphic trends reports, select [**Main Menu**]→[**Print Setup >>**]→[**Graphic Trends Reports >>**]. As setting up graphic trends reports is similar with tabular trends reports, you can refer to the Setting Up Tabular Trend Reports section for details.

24.5.4 Setting Up Realtime Reports

To set up realtime reports, select [**Main Menu**]→[**Print Setup >>**]→[**Realtime Reports >>**].

- [**Sweep**]: set the wave print speed.
- [**Select Wave >>**]: from the popup menu, you can:
  - [**Current**]: select the currently displayed waves for printing.
  - [**Select Wave**]: select the desired waves for printing.

24.6 End Case Reports

ECG reports, tabular trends reports, graphic trends reports, NIBP review reports and realtime reports can be set as end case reports. When you discharge a patient, the system will automatically print out all contents that are set as end case reports.

For example, to set ECG report as end case report:

1. select [**Main Menu**]→[**Print Setup >>**]→[**ECG Report >>**].
2. select [**End Case Report**]→[**Set as End Case Report**] and then select [**Ok**] from the popup dialog box.
3. set as described in the ***24.5.1Setting Up ECG Reports***.

24.7 Printer Statuses

24.7.1 Print Job Conflict

When the printer receives print requests from multiple monitors simultaneously or receives a print request from another monitor when a print job is in progress, it may lead to print job conflict and as a result an error may occur.

Therefore, before sending a print request, confirm the use status of all monitors and printers within the LAN to avoid print job conflict.

24.7.2 Printer Out of Paper

When the printer runs out of paper, the print request will not be responded. If there are too many print jobs that are not responded, a printer error may occur. In these cases, you need to install paper and then re-send the print request. Restart the printer if necessary.

Therefore, you'd better ensure that there is enough paper in the printer before sending a print request.

24.7.3 Use Central Monitoring System for Printing

If your monitor is connected to a central monitoring system, using the central monitoring system for printing is recommended.

24.7.4 Printer Status Messages

Printer Status Message	**Possible causes and suggested action**
Printer unavailable	The selected printer is not available. Check if the printer is switched on or correctly connected or installed with paper.

FOR YOUR NOTES

25 Other Functions

25.1 Marking Events

During patient monitoring, some events may exert effects on the patient and as a result change the waveforms or numerics displayed on the monitor. To help analysing the waveforms or numerics at that time, you can mark these events.

To mark an event:

1. Select [**Mark Event**] QuickKey, or [**Main Menu**]→[**Mark Event >>**].
2. Select [**Event A**] and the symbol [**@**] is displayed on the option.

When reviewing graphic trends, tabular trends or full-disclosure waveforms, the event symbols such as A, B, C and D are displayed at the time the event is triggered.

25.2 Analog Output

The patient monitor provides analog output signals to accessory equipment via the Auxiliary Output Connector on the rear of the monitor. To obtain analog output signals, connect the accessory equipment such as an oscillograph, etc. to the monitor and then follow this procedure:

1. Select [**Main Menu**]→[**Maintenance >>**]→[**User Maintenance >>**]→enter the required password.
2. Select [**Others >>**] to open the [**Others**] menu.
3. Select [**Auxiliary Output**] and then select [**Analog Out.**].
4. Select [**Main Menu**]→[**Analog Output Setup>>**].
5. Select [**Analog Out.**] and then select [**On**].
6. Select [**Waveform**] and then select a waveform you want to output.

NOTE

- **The analog output feature is seldom applied in clinical applications. You can contact your service personnel for more details.**

25.3 Nurse Call

The patient monitor also provides nurse call signals to a nurse call system connected to the monitor via the Auxiliary Output Connector. To obtain nurse call signals, connect a nurse call system to the monitor and then follow this procedure:

1. Select [**Main Menu**]→[**Maintenance >>**]→[**User Maintenance >>**]→enter the required password.
2. Select [**Others >>**] to access the [**Others**] menu.
3. Select [**Auxiliary Output**] and then select [**Nurse Call**].
4. Select [**Nurse Call Setup**] to change the nurse call settings as follows:

- Select [**Signal Type**] and toggle between [**Pulse**] and [**Continuous**].
  - [**Pulse**]: the nurse call signals are pulse signals and each pulse lasts 1 second. When multiple alarms occur simultaneously, only one pulse signal is outputted. If an alarm occurs but the previous one is not cleared yet, a new pulse signal will also be outputted.
  - [**Continuous**]: the nurse call signal lasts until the alarm ends, i.e. the duration of a nurse call signal equals to that of the alarm condition.
- Select [**Contact Type**] and toggle between [**Normally Open**] and [**Normally Closed**].
  - [**Normally Open**]: select if your hospital's nurse call relay contact is normally open.
  - [**Normally Closed**]: select if your hospital's nurse call relay contact is normally closed.
- Select [**Alm Lev**] and set the alarm level for nurse call-triggering alarms.
- Select [**Alarm Cat.**] and then select the category to which the nurse call-triggering alarms belong.

Alarm conditions are indicated to nurses only when:

- The nurse call system is enabled,
- An alarm that meets your preset requirements occurs, and
- The monitor is not in the alarm paused or silence status.

NOTE

- **If no setting is selected from [Alm Lev] or [Alarm Cat.], no nurse call signal will be triggered whatever alarms occur.**

⚠WARNING

- **Do not rely exclusively on the nurse call system for alarm notification. Remember that the most reliable alarm notification combines audible and visual alarm indications with the patient's clinical condition.**

25.4 Remote Display

This monitor enables remote display. It allows remote displays to be connected to the bedside monitor through network. The information coming from the monitor will be displayed on the remote display through the remote display driver so that clinical professionals can conveniently observe the patient's conditions from distance.

For details about remote display features, refer to the instructions for use accompanying the remote display driver.

NOTE

- **The contents displayed on the remote display are for convenient observance only and cannot be used for diagnostic interpretation.**
- **The user cannot operate the monitor through the remote display driver, namely, any operations performed through the remote display driver will not affect the monitor you observe.**

25.5 Wireless Network

The patient monitors, each equipped with a wireless network card, constitute a wireless network via AP (access point). The designated service engineer or personnel shall be responsible for installing and configuring the wireless network for you and perform relative performance tests as well.

NOTE

- **Comparing with the wired network, there may be some restrictions on the allocation of patient monitors, data transferring, etc.**
- **The existence of obstacles (such as wall) will exert impact on data transferring or even cause network interruption.**

26 Batteries

26.1 Overview

The monitor is designed to operate on battery power during intra-hospital patient transfer, or whenever AC power supply is interrupted. The battery is charged whenever the patient monitor is connected to an AC power source regardless of whether or not the patient monitor is currently on. Whenever the AC power is interrupted during patient monitoring, the patient monitor will automatically run power from the internal batteries.

On-screen battery symbols indicate the battery status as follows:

	Indicates that batteries work correctly. The solid portion represents the current charge level of the batteries in proportion to its maximum charge level.
	Indicates that the batteries have low charge level and need to be charged.
	Indicates that the batteries are almost depleted and need to be charged immediately.
	Indicates that no batteries are installed or only one battery is installed.

The capacity of the internal battery is limited. If the battery capacity is too low, a technical alarm will be triggered and the [**Battery Too Low**] message displayed. At this moment, apply AC power to the patient monitor. Otherwise, the patient monitor will power off automatically before the battery is completely depleted.

NOTE

- **Take out the battery before the monitor is transported or will not be used for a long time.**

⚠ WARNING

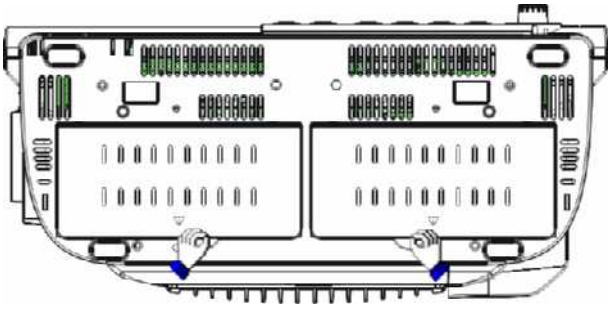
- **Keep the battery out of children's reach.**
- **Use only specified batteries.**

26.2 Installing the Batteries

The patient monitor uses two battery packs. If the two batteries have very different charge capacity, the message [**Diff. Battery Voltages**] is displayed. In this case, apply AC power to the patient monitor until the two batteries have approximately equal charge capacity or are both fully charged. You cannot use them before they have approximately equal charge capacity or are fully charged. In situations where no patient monitoring is performed or interrupting the patient monitoring is permitted, you can replace the batteries.

The patient monitor uses two batteries. You can install the batteries by following this procedure:

1. Turn off the patient monitor and disconnect the power cord and other cables.
2. Place the patient monitor with its face up.
3. Open the battery compartment door.



4. Place the batteries into the slots per the “+” and “-” indications.
5. Close the battery door and place the patient monitor upright.

26.3 Conditioning the Batteries

A battery needs at least two conditioning cycles when it is put into use for the first time. A battery conditioning cycle is one complete, uninterrupted charge of the battery, followed by an uninterrupted discharge of the battery. Batteries should be conditioned regularly to maintain their useful life. Condition the batteries once when they are used or stored for two months, or when their run time becomes noticeably shorter.

To condition the batteries, follow this procedure:

1. Disconnect the patient monitor from the patient and stop all monitoring and measuring procedures.
2. Insert the two batteries in need of conditioning into the battery slots of the patient monitor.
3. Apply AC power to the patient monitor and allow the batteries to charge uninterruptedly for above 6 hours.
4. Remove AC power and allow the patient monitor to run from the batteries until it shuts off.
5. Apply AC power again to the patient monitor and allow the batteries to charge uninterruptedly for above 6 hours.
6. This battery is now conditioned and the patient monitor can be returned to service.

26.4 Checking the Batteries

The performance of the rechargeable batteries may deteriorate over time. To check the performance of the batteries, follow this procedure:

1. Disconnect the patient monitor from the patient and stop all monitoring and measuring procedures.
2. Apply AC power to the patient monitor and allow the batteries to charge uninterruptedly for above 6 hours.
3. Remove AC power and allow the patient monitor to run from the batteries until it shuts off.
4. The operating time of the batteries reflects their performance directly.

If the operating time of the batteries is noticeably shorter than that stated in the specifications, replace the batteries or contact your service personnel.

NOTE

- **Life expectancy of a battery depends on how frequent and how long it is used. For a properly maintained and stored lithium-ion battery, its life expectancy is about 3 years. For more aggressive use models, life expectancy can be less. We recommend replacing lithium-ion batteries every 3 years.**
- **The operating time depends on the configuration and operation. For example, monitoring NIBP repeatedly will also shorten the operating time of the batteries.**

26.5 Recycling the Batteries

When a battery has visual signs of damage, or no longer holds a charge, it should be replaced. Remove the old battery from the patient monitor and recycle it properly. To dispose of the batteries, follow local laws for proper disposal.

⚠ WARNING

- **Do not disassemble batteries, or dispose of them in fire, or cause them to short circuit. They may ignite, explode, or leak, causing personal injury.**

27 Care and Cleaning

Use only the substances approved by us and methods listed in this chapter to clean or disinfect your equipment. Warranty does not cover damage caused by unapproved substances or methods.
We make no claims regarding the efficacy of the listed chemicals or methods as a means for controlling infection. For the method to control infection, consult your hospital's Infection Control Officer or Epidemiologist.

27.1 General Points

Keep you equipment and accessories free of dust and dirt. To avoid damage to the equipment, follow these rules:

- Always dilute according the manufacturer's instructions or use lowest possible concentration.
- Do not immerse part of the equipment into liquid.
- Do not pour liquid onto the equipment or accessories.
- Do not allow liquid to enter the case.
- Never use abrasive materials (such as steel wool or silver polish), or erosive cleaners (such as acetone or acetone-based cleaners).

⚠ WARNING

- **Be sure to shut down the system and disconnect all power cables from the outlets before cleaning the equipment.**

⚠ CAUTION

- **If you spill liquid on the equipment or accessories, contact us or your service personnel.**

NOTE

- **To clean or disinfect reusable accessories, refer to the instructions delivered with the accessories.**

27.2 Cleaning

Your equipment should be cleaned on a regular basis. If there is heavy pollution or lots of dust and sand in your place, the equipment should be cleaned more frequently. Before cleaning the equipment, consult your hospital's regulations for cleaning the equipment.

Recommended cleaning agents are:

- mild soap (diluted)
- ammonia (diluted)
- sodium hypochlorite bleach (diluted)
- Hydrogen peroxide (3%)
- Ethanol (70%)
- Isopropanol (70%)

To clean your equipment, follow these rules:

1. Shut down the patient monitor and disconnect it from the power line.
2. Clean the display screen using a soft, clean cloth dampened with a glass cleaner.
3. Clean the exterior surface of the equipment using a soft cloth dampened with the cleaner.
4. Wipe off all the cleaning solution with a dry cloth after cleaning if necessary.
5. Dry your equipment in a ventilated, cool place.

27.3 Disinfecting

Disinfection may cause damage to the equipment and is therefore not recommended for this patient monitor unless otherwise indicated in your hospital's servicing schedule. Cleaning equipment before disinfecting is recommended.

The recommended disinfectants include: ethanol 70%, isopropanol 70%, glutaraldehyde-type 2% liquid disinfectants

⚠ CAUTION

- **Never use EtO or formaldehyde for disinfection.**

28 Maintenance

⚠WARNING

- **Failure on the part of the responsible individual hospital or institution employing the use of this equipment to implement a satisfactory maintenance schedule may cause undue equipment failure and possible health hazards.**
- **The safety checks or maintenance involving any disassembly of the equipment should be performed by professional servicing personnel. Otherwise, undue equipment failure and possible health hazards could result.**
- **If you discover a problem with any of the equipment, contact your service personnel or us.**

28.1 Safety Checks

Before every use, after your patient monitor has been used for 6 to 12 months, or whenever your patient monitor is repaired or upgraded, a thorough inspection should be performed by qualified service personnel to ensure the reliability.

Follow these guidelines when inspecting the equipment:

- Make sure that the environment and power supply meet the requirements.
- Inspect the equipment and its accessories for mechanical damage.
- Inspect all power cords for damage, and make sure that their insulation is in good condition.
- Make sure that only specified accessories are applied.
- Inspect if the alarm system functions correctly.
- Make sure that the recorder functions correctly and the recorder paper meets the requirements.
- Make sure that the batteries meet the performance requirements.
- Make sure that the patient monitor is in good working condition.
- Make sure that the grounding resistance and leakage current meet the requirement.

In case of any damage or abnormity, do not use the patient monitor. Contact the hospital's biomedical engineers or your service personnel immediately.

28.2 Service Tasks

The following tasks are for our qualified service professionals only. Contact a qualified service provider if your patient monitor needs the following services. Clean and disinfect equipment to decontaminate it before testing or maintaining it.

Maintenance schedule	Frequency
Safety checks according to IEC60601-1	At least once every two years, after any repairs where the power supply is replaced, or if the patient monitor has been dropped.
Performance assurance for all measurements not listed below	At least once every two years, of if you doubt the measured values.
Defibrillator synchronization	At least once every two years, or as needed.
NIBP leakage test	At least once every two years, or by your hospital policy.
NIBP accuracy test	At least once every two years, or by your hospital policy.
NIBP calibration	At least once every two years, or by your hospital policy.
CO_2 calibration and performance test	At least once every two years, or if you doubt the measured values.
AG calibration	At least once every two years, or if you doubt the measured values.
AG preventative maintenance (pump check, internal fan check, ambient pressure check and so forth as described in the service manual)	At least once every two years, or if you doubt the measured values.

28.3 Checking Monitor and Module Information

To view the information about system start time, selftest, etc., select [**Main Menu**]→[**Maintenance** >>]→[**Monitor Information** >>]. You can print out the information for the convenience of troubleshooting. The information will not be saved during shut down.

You can also view the information about the monitor configuration and system software version by selecting [**Main Menu**]→[**Maintenance** >>]→[**Software Version** >>].

28.4 Calibrating ECG

The ECG signal may be inaccurate due to hardware or software problems. As a result, the ECG wave amplitude becomes greater or smaller. In that case, you need to calibrate the ECG module.

1. Select the ECG parameter window or waveform area→[**Filter**]→[**Diagnostic**].
2. Select [**Main Menu**]→[**Maintenance** >>]→[**Calibrate ECG**]. A square wave appears on the screen and the message [**ECG Calibrating**] is displayed.
3. Compare the amplitude of the square wave with the wave scale. The difference should be within 5%.
4. After the calibration is completed, select [**Stop Calibrating ECG**]

You can print out the square wave and wave scale and then measure the difference between them if necessary. If the difference exceeds 5%, contact your service personnel.

28.5 Calibrating the Touchscreen

1. Select [**Cal. Screen**] QuickKey, or [**Main Menu**]→[**Maintenance** >>]→[**User Maintenance** >>]→enter the required password→[**Cal. Touchscreen**].
2.  will, in turn, appear at different positions of the screen.
3. Select each  as it appears on the screen.
4. After the calibration is completed, the message [**Screen Calibration Completed!**] is displayed. Select [**Ok**] to confirm the completion of the calibration.

28.6 Calibrating CO_2

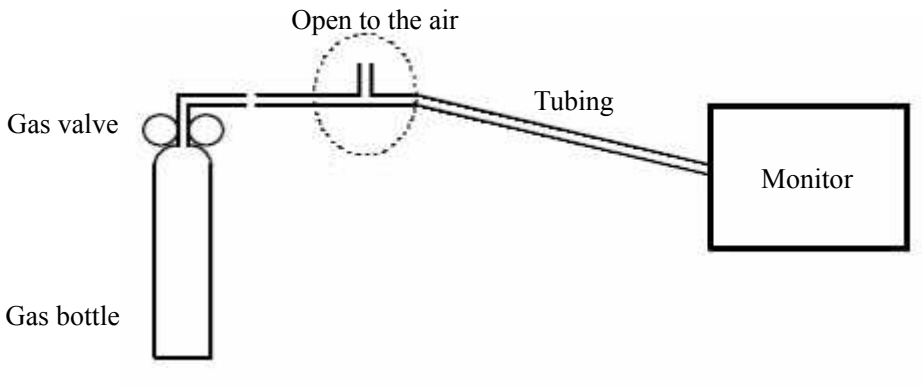
For sidestream and microstream CO_2 modules, a calibration is needed every year or when the measured values have a great deviation. For maintream CO_2 module, no calibration is needed.

Tools required:

- Gas bottle, with 4%, 5% or 6% of CO_2.
- T-shape connector
- Tubing

Follow this procedure to perform a calibration:

1. Make sure that the CO_2 module has been warmed up or started up.
2. Select [**Main Menu**]→[**Maintenance >>**]→[**User Maintenance >>**]→enter the required password→[**Maintain CO2 >>**]→[**Calibrate CO2 >>**].
3. In the [**Calibrate CO2**] menu, select [**Zero**].
4. Connect the gas bottle with the tubing using a T-shape connector as shown below. Check the airway and make sure there are no leaks.



5. Vent the tubing to the CO_2 opening the gas valve.
6. In the [**Calibrate CO2**] menu, enter the vented CO_2 concentration in the [**CO2**] field.
7. In the [**Maintain CO2**] menu, the measured CO_2 concentration, barometric pressure, sensor temperature and current flowrate are displayed. After the measured CO_2 concentration becomes stable, select [**Calibrate CO2**] to calibrate the CO_2 module.
8. If the calibration is finished successfully, the message [**Calibration Completed!**] is displayed. If the calibration failed, the message [**Calibration Failed!**] is displayed. Perform another calibration.
9. Select ✕ to exit the current menu.

28.7 Calibrating AG

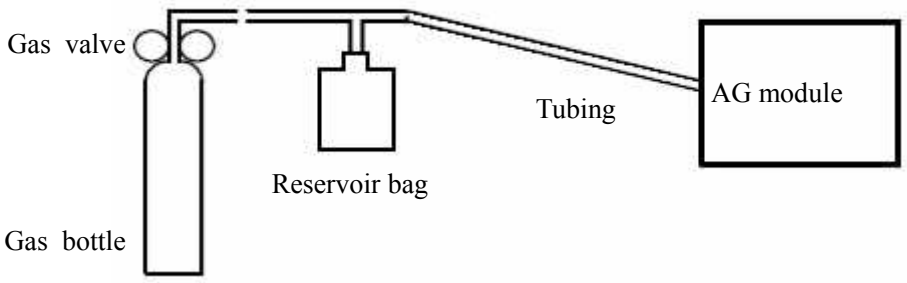
Calibrate the AG module every year or when the measured value has a great deviation.

Tools required:

- Gas bottle, with a certain standard gas or mixture gas. Gas concentration should meet the following requirements: AA>1.5%, CO_2>1.5%, N_2O>40%, O_2>40%, of which AA represents an anesthetic agent.
- T-shape connector
- Tubing
- Reservoir bag

Follow this procedure to perform a calibration:

1. Select [**Main Menu**]→[**Maintenance >>**]→[**User Maintenance >>**]→enter the required password→[**Calibrate AG >>**].
2. Check the airway and make sure that there are no occlusions or leaks.
   - ◆ Vent the tubing to the air and check if the [**Current FlowRate**] and [**Set FlowRate**] are approximately the same. If the deviation is great, it indicates that there is an occlusion in the tubing. Check the tubing for an occlusion.
   - ◆ Block the gas inlet of the tubing. The [**Current FlowRate**] shall fall rapidly and the system prompt that the tubing is blocked. Otherwise, it indicates that there are leakages in the tubing. Check the tubing for leakages.
3. Connect the gas bottle, reservoir bag and the tubing using a T-shape connector as shown in the figure below. Check the airway and make sure there are no leaks.
4. Vent the tubing to a certain standard gas or mixture gas opening the gas valve.



5. In the [**Calibrate AG**] menu, the concentration and flowrate of each measured gas are displayed
   - ◆ If the difference between the measured gas concentration and the actual one is very small, a calibration is not needed.

- If the difference is great, you should perform a calibration. Select [**Calibrate >>**] to enter the calibrate menu.

6. Enter the vented gas concentration. If you use only one gas for calibration, set other gases' concentration to 0.
7. Select [**Calibrate**] to start calibration.
8. If the calibration is finished successfully, the message [**Calibration Completed!**] is displayed. If the calibration failed, the message [**AG Cal. Failed**] is displayed. Perform another calibration.
9. Select ✕ to exit the current menu.

28.8 Setting up IP Address

1. Select [**Main Menu**]→[**Maintenance >>**]→[**User Maintenance** >>]→enter the required password.
2. Select [**IP Address Setup >>**] to change IP address settings.

If the patient monitor is connected to a CMS, its IP address should be set up. The user should not change the patient monitor's IP address randomly. If you want to know details about IP address setup, contact the technical personnel in charge of the CMS.

28.9 Entering/Exiting Demo Mode

To enter the Demo mode:

1. Select [**Main Menu**]→[**Maintenance >>**].
2. Select [**Demo >>**]. Enter the required password and then select [**Ok**].

To exit the Demo mode:

1. Select [**Main Menu**]→[**Maintenance >>**].
2. Select [**Exit Demo**] and then select [**Ok**].
3. The patient monitor exits the Demo mode.

⚠WARNING

- **The Demo mode is for demonstration purpose only. To avoid that the simulated data are mistaken for the monitored patient's data, you must not change into Demo mode during monitoring. Otherwise, improper patient monitoring and delayed treatment could result.**

29 Accessories

⚠WARNING

- **Use accessories specified in this chapter. Using other accessories may cause damage to the patient monitor or not meet the claimed specifications.**
- **Single-use accessories are not designed to be reused. Reuse may cause a risk of contamination and affect the measurement accuracy.**
- **Check the accessories and their packages for any sign of damage. Do not use them if any damage is detected.**

29.1 ECG Accessories

ECG Electrodes

Model	Quantity	Patient Category	Part No.
210	10 pieces	Adult	0010-10-12304
2249	25 pieces		0509-10-00094
2245	25 pieces	Pediatric	9000-10-07469
2258-3	3 pieces	Neonate	900E-10-04880

12-Pin Trunk Cables

Leadwire supported	Compatible with	Type	Patient Category	Part No.
3-leadwire	AHA, IEC	Defibrillator-proof	Pediatric, neonate	0010-30-42720
3-leadwire	AHA, IEC	ESU-proof		0010-30-42724
3/5-leadwire	AHA, IEC	Defibrillator-proof	Adult, pediatric	0010-30-42719
3/5-leadwire	AHA, IEC	ESU-proof		0010-30-42723
10-leadwire	AHA	Defibrillator-proof		0010-30-42721
10-leadwire	IEC	Defibrillator-proof		0010-30-42722

Cable Sets

3-Electrode Cable Sets					
Type	**Compatible with**	**Model**	**Patient Category**	**Part No.**	**Remark**
Clip	IEC	EL6302A	Adult, pediatric	0010-30-42725	/

29.2 SpO_2 Accessories

Extension Cable

Module type	Part No.
MPM SpO_2 Module	0010-20-42710
Masimo SpO_2 Module	0010-30-42738
Nellcor SpO_2 Module	0010-20-42712

SpO_2 Sensors

The SpO_2 sensor material that patients or other staff will come into contact with have undertaken the bio-compatibility test and is verified to be in compliance with ISO 10993-1.

MPM SpO2 Module			
Type	**Model**	**Patient Category**	**Part No.**
Disposable	MAX-A	Adult (>30Kg)	0010-10-12202
	MAX-P	Pediatric (10 to 50Kg)	0010-10-12203
	MAX-I	Infant (3 to 20Kg)	0010-10-12204
	MAX-N	Neonate (<3Kg), Adult (>40Kg)	0010-10-12205
Single patient use	520A	Adult	520A-30-64101
	520P	Pediatric	520P-30-64201
	520I	Infant	520I-30-64301
	520N	Neonate	520N-30-64401
Reusable	DS-100A	Adult	9000-10-05161
	OXI-P/I	Pediatric, infant	9000-10-07308
	OXI-A/N	Adult, neonate	9000-10-07336
	518B	Adult, pediatric, neonate (Multi-sites)	518B-30-72107
	512D	Adult (Finger type)	512D-30-90200
	512E		512E-30-90390
	512F		512F-30-28263
	512G	Pediatric (Finger type)	512G-30-90607
	512H		512H-30-79061

Masimo SpO2 Module				
Type	**Model**	**Patient Category**	**Remark**	**Part No.**
Disposable	FPS-1901	Pediatric, neonate	LNCS-NeoPt-L	0010-10-42626
	FPS-1862	Neonate	LNCS-Neo-L	0010-10-42627
	FPS-1861	Infant	LNCS-Inf-L	0010-10-42628
	FPS-1860	Pediatric	LNCS-Pdt	0010-10-42629
	FPS-1859	Adult	LNCS-Adt	0010-10-42630
Reusable	FPS-1863	Adult	LNCS DC-I	0010-10-42600
	FPS-1864	Pediatric	LNCS-DCIP	0010-10-42634
	2258	Adult, pediatric, neonate	LNCS YI	0010-10-43016

Nellcor SpO2 Module			
Type	**Model**	**Patient Category**	**Part No.**
Disposable	MAX-A	Adult (>30Kg)	0010-10-12202
	MAX-P	Pediatric (10 to 50Kg)	0010-10-12203
	MAX-I	Infant (3 to 20Kg)	0010-10-12204
	MAX-N	Neonate (<3Kg), Adult (>40Kg)	0010-10-12205
Reusable	DS-100A	Adult	9000-10-05161
	OXI-P/I	Pediatric, infant	9000-10-07308
	OXI-A/N	Adult, neonate	9000-10-07336

- Wavelength emiited by the sensors intended for MPM SpO_2 module: 512D: red right: 660 nm, infrared light: 940 nm; other SpO_2 sensors: red right: 660 nm, infrared light: 905 nm.
- Wavelength emitted by the sensors intended for Masimo SpO_2 module: red light: 660 nm, infrared light: 940 nm.
- Wavelength emitted by the sensors intended for Nellcor SpO_2 module: red light: 660 nm, infrared light: 890 nm.
- The maximum photic output consumption of the sensor is less than 18 mW.

The information about the wavelength range and maximum photic output consumption can be especially useful to clinicians, for example, clinicians performing photodynamic therapy.

29.3 NIBP Accessories

Tubing

Type	Patient Category	Part No.
Reusable	Adult, pediatric	6200-30-09688
	Neonate	6200-30-11560

Reusable Cuff

Model	Patient Category	Measurement Site	Limb Circumference (cm)	Bladder Width (cm)	Part No.
CM1201	Infant	Arm	10 to 19	9.2	0010-30-12157
CM1202	Pediatric		18 to 26	12.2	0010-30-12158
CM1203	Adult		24 to 35	15.1	0010-30-12159
CM1204	Large adult		33 to 47	18.3	0010-30-12160
CM1205	Thigh	Thigh	46 to 66	22.5	0010-30-12161

Single-Patient Cuff

Model	Patient Category	Measurement Site	Limb Circumference (cm)	Bladder Width (cm)	Part No.
CM1500A	Neonate	Arm	3.1 to 5.7	2.2	001B-30-70692
CM1500B			4.3 to 8.0	2.9	001B-30-70693
CM1500C			5.8 to 10.9	3.8	001B-30-70694
CM1500D			7.1 to 13.1	4.8	001B-30-70695
CM1501	Infant		10 to 19	7.2	001B-30-70697
CM1502	Pediatric		18 to 26	9.8	001B-30-70698
CM1503	Adult		25 to 35	13.1	001B-30-70699
CM1504	Large adult		33 to 47	16.5	001B-30-70700
CM1505	Adult	Thigh	46 to 66	20.5	001B-30-70701

Disposable Cuff

Model	Patient Category	Measurement Site	Limb Circumference (cm)	Bladder Width (cm)	Part No.
M1872A	Neonate	Arm	7.1 to 13.1	5.1	900E-10-04873
M1870A			5.8 to 10.9	4.3	900E-10-04874
M1868A			4.3 to 8.0	3.2	900E-10-04875
M1866A			3.1 to 5.7	2.5	900E-10-04876

29.4 Temp Accessories

Extension Cable

Type	Model	Temp probe	Part No.
Reusable	MR420B	MR411, MR412	0011-30-37391

Temp Probes

Type	Model	Patient Category	Measurement Site	Part No.
Reusable	MR401B	Adult	Esophageal/Rectal	0011-30-37392
	MR403B		Skin	0011-30-37393
	MR402B	Pediatric, neonate	Esophageal/Rectal	0011-30-37394
	MR404B		Skin	0011-30-37395
Disposable	MR411	Adult, pediatric, neonate	Esophageal/Rectal	0011-30-37398
	MR412		Skin	0011-30-37397

29.5 IBP/ICP Accessories

Accessories Kit No.	Components	Part No.
6800-30-50876 (Hospira)	IM2201 12Pin IBP Cable	001C-30-70759
	Disposable Transducer	0010-10-42638
	Steady Rest for IBP Transducer and Clamp	M90-000133---
	Steady Rest for IBP Transducer and Clamp	M90-000134---
6800-30-50877 (BD)	IM2202 12Pin IBP Cable	001C-30-70757
	Disposable Pressure Transducer	6000-10-02107
	Transducer/Manifold Mount	0010-10-12156
ICP		
Model	**Material**	**Part No.**
Gaeltec TYPE.S13	12Pin ICP cable	0010-30-42742
Gaeltec ICT/B	Intracranial Pressure Transducer	0010-10-12151

It is proved through tests that the following accessories are compatible with the patient monitor. Only the accessories proceeded by "*" are available from our company. If you want to purchase other accessories, contact respective manufacturers and make sure if these accessories are approved for sale in local.

Manufacturer	Accessories
Smith Medical (Medex)	MX961Z14 Logical Cable, to be used in connection with the Adapter Cable (0010-20-42795) MX960 Reusable Transducer Kit MX9605A Logical 84in(213cm) Single Monitoring Kit MX960 Logical Tranducer Mounting Plate MX261 Logical Clamp For Transducer Bracket MX262 Logical Clamp For 2 Transducer Mount Plates (More Logical Clamps are available from Medex. For detailed information, contact Medex.)
Braun	IBP Reusable Cable (REF: 5203511), to be used in connection with the Adapter Cable (0010-20-42795) Combitrans Monitoring Set (contact Braun for detailed information) Combitrans Attachment Plate Holder (REF：5215800) Combitrans Attachment Plate (contact Braun for detailed information)
Memscap	*Truck cable (0010-21-43082) SP844 Physiological Pressure Transducer 844-26 Monitoring Line Set 84X-49 Mounting Bracket

Utah	Reusable Blood Pressure Monitor Interface Cable (REF: 650-206) Deltran Disposable Pressure Transducer System (More Deltran sensors are available from Utah. For detailed information, contact Utah.) Pole Mount Unit (ERF: 650-150) Deltran Three Slot Organizer, Attaches to I.V. Pole Mount (REF: 650-100) Deltran Four Slot Organizer, Attaches to I.V. Pole Mount (REF: 650-105)
Edwards	* IBP Truwave Reusable Cable (0010-21-12179) Pressure Monitoring Kit With Truwave Disposable Pressure Transducer. (More Truwave sensors are available from Edwards. For detailed information, contact Edwards.) DTSC IV Pole Clamp for Model DTH4 Backplate Holder DTH4 Disposable Holder for DPT

29.6 C.O. Accessories

C.O. feature is not available in USA.

Model	Material	Part No.
COC-001-SL	12Pin C.O. cable.	0010-30-42743
SP4042	IT Sensor	6000-10-02079
SP5045	IT Sensor Housing	6000-10-02080
12CC	12CC Control Syringe W/1CC Stop W/Rotator	6000-10-02081
131HF7	Dilution Hose	6000-10-02183

29.7 CO_2 Accessories

Sidestream CO_2 module

Material	Patient Category	Remark	Part No.
DRYLINE Watertrap	Adult, pediatric	Reusable	9200-10-10530
DRYLINE Watertrap	Neonate		9200-10-10574
Sampling Line, Adult 2.5m	Adult, pediatric	Disposable	9200-10-10533
Sampling Line, Neonate, 2.5m	Neonate		9200-10-10555
Adult Nasal CO_2 Sample Cannula	Adult		M02A-10-25937
Pediatric Nasal CO_2 Sample Cannula	Pediatric		M02A-10-25938
Infant Nasal CO2 Sample Cannula	Infant		M02B-10-64509
DRYLINE Airway Adapter	/	Straight	9000-10-07486

29.8 AG Accessories

Material	Patient Category	Remark	Part No.
Watertrap	Adult, pediatric	Reusable	9200-10-10530
	Neonate		9200-10-10574
Sampling line	Adult, pediatric	Disposable	9200-10-10533
	Neonate		9200-10-10555
Airway adapter	Adult, pediatric, neonate	Disposable, straight	9000-10-07486
	Adult, pediatric, neonate	Disposable, elbow	9000-10-07487

29.9 ICG Accessories

Material	Part No.
BioZ tect ICG sensor	0010-10-42675
BioZ Dx Patient Cable	0010-10-42676
BioZ Dx Lead Wire Array	0010-10-42677

29.10 BIS Accessories

Material	Patient Category	Part No.
BIS sensor (Quatro XP, 4 Electrode)	Adult	0010-10-42672
BIS sensor (Pediatric XP, 4 Electrode)	Pediatric	0010-10-42673
BIS Cable	Adult, pediatric	6800-30-50761

29.11 RM Accessories

Material	Patient Category	Remark	Part No.
Flow sensor	Adult, pediatric	Reusable	0010-30-42678
	Adult, pediatric	Disposable	0010-30-42679
	Neonate	Disposable	0010-30-42680
RM connector	/	/	6800-20-50328

29.12 Others

Material	Part No.
Lithium battery	M05-010002-06
Power cord (India)	0000-10-10903
Domestic power cord (America)	DA8K-10-14452
Three-wire power cord (Britain)	DA8K-10-14453
Three-wire power cord (Europe)	DA8K-10-14454
Grounding cable	1000-21-00122
Defibrillator synchronization cable	6800-20-50781
Nurse call cable	8000-21-10361
Satellite module rack wall mount bracket	0010-30-42867
Keyboard wall mount bracket	0010-30-42868
Main unit wall mount bracket	0010-30-42955
Display wall mount bracket	0010-30-42956
Roll stand	0010-30-42943
Trolley-Mount Bracket	0010-30-42944

FOR YOUR NOTES

A Product Specifications

A.1 Monitor Safety Specifications

A.1.1 Classifications

The patient monitor is classified, according to IEC60601-1:

Components	Type of protection against electrical shock	Degree of protection against electrical shock	Degree of protection against harmful ingress of water	Degree of protection against hazards of explosion	Mode of operation
Main unit	I	Not marked	Ordinary	Not suitable	Continuous
Secondary display		Not marked			
MPM	NA	CF			
IBP module					
C.O. module					
ICG module					
BIS module		BF			
AG module					
CO_2 module					
RM module					
SMR		Not marked			

- I: Class I equipment
- BF: Type BF applied part
- CF: Type CF applied part
- NA: Not applicable
- Ordinary: Ordinary equipment (enclosed equipment without protection against ingress of water)
- Not suitable: Equipment not suitable for use in the presence of a flammable anesthetic mixture with air with oxygen or nitrous oxide.

A.1.2 Environmental Specifications

Main unit, MPM, IBP module, C.O. module, Recorder		
Item	**Operating conditions**	**Storage conditions**
Temperature (ºC)	5 to 40	-20 to 60
Relative humidity (noncondensing)	15% to 95%	10% to 95%
Barometric (mmHg)	425 to 809	120 to 809

Microstream CO_2 module		
Item	**Operating conditions**	**Storage conditions**
Temperature (ºC)	0 to 40	-20 to 60
Relative humidity (noncondensing)	15% to 95%	10% to 95%
Barometric (mmHg)	430 to 795	430 to 795

Sidestream CO_2 module		
Item	**Operating conditions**	**Storage conditions**
Temperature (ºC)	5 to 35	-20 to 60
Relative humidity (noncondensing)	15% to 95%	15% to 95%
Barometric (mmHg)	428 to 790	428 to 790

Mainstream CO_2 module		
Item	**Operating conditions**	**Storage conditions**
Temperature (ºC)	10 to 40	-10 to 50
Relative humidity (noncondensing)	10% to 90%	0% to 90%
Barometric (mmHg)	400 to 850	400 to 850

AG module		
Item	**Operating conditions**	**Storage conditions**
Temperature (ºC)	10 to 40	-20 to 70
Relative humidity (noncondensing)	15% to 95%	10% to 95%
Barometric (mmHg)	525 to 900	525 to 900

RM module		
Item	**Operating conditions**	**Storage conditions**
Temperature (ºC)	5 to 40	-20 to 60
Relative humidity (noncondensing)	15% to 95%	10% to 95%
Barometric (mmHg)	500 to 800	500 to 800

BIS module		
Item	**Operating conditions**	**Storage conditions**
Temperature (ºC)	0 to 40	-20 to 50
Relative humidity (noncondensing)	10% to 95%	10% to 95%
Barometric (mmHg)	356 to 760	356 to 760

ICG module		
Item	**Operating conditions**	**Storage conditions**
Temperature (ºC)	10 to 40	0 to 50
Relative humidity (noncondensing)	15% to 95%	15% to 95%
Barometric (mmHg)	619 to 780	619 to 780

A.1.3 Power requirements

Line voltage	100 to 240 VAC
Current	2.8 to 1.6 A
Frequency	50/60 Hz
Fuse	Time-lag 250V T4A

A.2 Physical Specifications

Components	Weight	Size	Equipment type
Main unit	<14.5 kg	400×370×193 mm	Includes a 17" touchscreen, an MPM, an AG module, two lithium batteries, a recorder, CF components, but no accessories.
SMR	<1.8 kg	142×402×151 mm	With no module inserted
MPM	<0.63 kg	136.5×80.5×102 mm	
IBP module	<0.25 kg	136.5×40×102 mm	
C.O. module	<0.25 kg	136.5×40×102 mm	Not available in USA
Sidestream CO_2 module	<0.48 kg	136.5×80.5×102 mm	
Microstream CO_2 module	<0.37 kg	136.5×40×102 mm	
Mainstream CO_2 module	<0.50 kg	136.5×40×102 mm	
M-type AG module	<1.75 kg	136.5×121×102 mm	With O_2 and BIS modules
A-type AG module	<1.75 kg	136.5×121×102 mm	With O_2 and BIS modules
ICG module	<0.35 kg	136.5×40×102 mm	
BIS module	<0.25 kg	136.5×40×102 mm	
RM module	<0.27 kg	136.5×40×102 mm	

A.3 Hardware Specifications

A.3.1 Display

Host display	
Screen type	Color TFT LCD
Screen Size (diagonal)	17"
Resolution	1280×1024 pixels
External display	
Screen type	Medical-grade TFT LCD
Screen Size	15", 17" or above
Resolution	1024×768 pixels
EMC	MPR II, CISPR 11B
Third certificate	UL, C-UL, TUV, CE, FCC

A.3.2 Recorder

Method	Thermal dot array
Horizontal resolution	16 dots/mm (25 mm/s paper speed)
Vertical resolution	8 dots/mm
Paper width	50 mm
Paper length	20 m
Paper speed	25 mm/s, 50 mm/s
Number of waveform channels	1, 2, or 3 (optional)

A.3.3 Battery

Size	147.5×60.4×23.8 mm
Weight	350 g
Number of batteries	2
Battery Type	Chargeable Lithium-Ion
Voltage	11.1 VDC
Capacity	4500 mAh
Run time	120 min 2 new, fully charged batteries at 25°C under typical conditions (with SpO_2 sensor but no ECG, Temp and IBP cables connected, and auto NIBP measurements at intervals of 15 minutes).
Charge time	6 h at most (in standby mode)
Shutdown delay	10 to 15 min (after a low battery alarm first occurs)

A.3.4 LEDs

Physiological alarm lamp	1 (two color coded: yellow and red)
Technical alarm lamp	1 (blue)
Power on LED	1 (green)
AC power LED	1 (green)
Battery LED	1 (green)

A.3.5 Audio Indicator

Speaker	Give alarm tones (45 to 85 dB), key tones, QRS tones; support PITCH TONE and multi-level tone modulation; alarm tones comply with IEC60601-1-8.

A.3.6 Monitor Interface Specifications

Power	1 AC power input connector
Wire network	2 RJ45 connector, 100 Base-TX, IEEE 802.3
USB	10 connectors, USB 1.1
SMR connector	1 connector, not standard USB
CF	50-pin CF revision 2.0 connector
Video interface	1 connector, standard DVI-D
Auxiliary output	1 connector, standard BNC, the common connector of nurse call signals and analog output signals
Equipotential Grounding Terminal	1
Defib Sync Connector	1 connector, RJ11

A.3.7 Outputs

Auxiliary Output	
Standard	Meets the requirements of IEC60601-1 for short-circuit protection and leakage current
Output impedance	50 Ω rating
ECG Analog Output	
Bandwidth (-3dB; reference frequency: 10Hz)	Diagnostic mode: 0.05 to 150 Hz Monitor mode: 0.5 to 40 Hz Surgical mode: 1 to 20 Hz
Max transmission delay	25 ms (in diagnostic mode, and with Notch off)
Sensitivity	1V/mV ±5%
PACE rejection/enhancement	No pace rejection or enhancement
IBP Analog Output	
Bandwidth (-3dB; reference frequency:1Hz)	0 to 12.5 Hz
Max transmission delay	55 ms (with Notch off)
Sensitivity	1 V/100 mmHg ±5%
Nurse Call Signal	
Output mode	Relay

Electrical requirements	≤60W, ≤2A, ≤36VDC, ≤25VAC
Isolation voltage	1500 VAC
Contact type	Normally open or normally contact (optional)
Defib Sync Pulse	
Output impedance	50 Ω
Max time delay	35 ms (R-wave peak to leading edge of pulse)
Amplitude	High level: 3.5 to 5 V, providing a maximum of 1 mA output current; Low level: < 0.5 V, receiving a maximum of 5 mA input current.
Pulse width	100 ms ±10%
Limited current	15 mA rating
Rising and falling time	<1 ms
Digital video output (DVI-D connector)	
Video signals	Single Link TMDS
DDC signals	Signals 12C compliant

A.4 Data Storage

Trends	Trends: 120 hours, at 1 min resolution Minitrends: 1 hour, at 1 s resolution
Parameter alarms	100 alarms and related parameter waveforms. The waveform recording length can be 8s, 16s or 32s.
Arrh. events	100 arrhythmia events and relate waveforms. The waveform recording length can be 8s, 16s or 32s.
NIBP measurements	1000 sets
12-lead ECG analysis results	40 sets
Full-disclosure waveforms	24 hours at maximum. The specific storage time depends on the waveforms stored and the number of stored waveforms.

A.5 Wireless Network

Standards	IEEE 802.11g, Wi-Fi compatible						
Frequenct range	2.412 to 2.462GHz						
Operating channel	China	America	Canada	Europe	Spain	France	Japan
	1 to 11				10, 11		2
	For other country, please refer to your local law.						
Safe distance	10 m (a circle centering AP with the diameter of 10 m)						

A.6 Measurement Specifications

The adjustable range of alarm limits is the same with the measurement range of signals unless otherwise specified.

A.6.1 ECG

ECG	
Standards	Meet standards of EC11, EC13, EN60601-2-27/IEC60601-2-27 and IEC60601-2-25
Lead set	3-lead: I, II, III 5-lead: I, II, III, aVR, aVL, aVF, V 12-lead: I, II, III, aVR, aVL, aVF, V1 to V6
ECG standard	AHA, IEC
Display sensitivity	1.25 mm/mV (X0.125), 2.5 mm/mV (X0.25), 5 mm/mV (X0.5), 10 mm/mV (X1), 20 mm/mV (X2), Auto
Sweep speed	12.5 mm/s, 25 mm/s, 50 mm/s
Bandwidth (-3dB)	Diagnostic mode: 0.05 to 150 Hz Monitor mode: 0.5 to 40 Hz Surgical mode: 1 to 20 Hz
Common mode rejection ratio (with Notch off)	Diagnostic mode: ≥90 dB Monitor mode: ≥105 dB Surgical mode: ≥105 dB
Notch	50/60 Hz Monitor and surgical mode: Notch turns on automatically. Diagnostic mode: Notch is turned on/off manually
Differential input impedance	≥5 MΩ
Input signal range	±8 mV (peak-to-peak value)
Accuracy of reappearing input signal	Use A and D methods based on EC11 to determine system total error and frequency response.
Electrode offset potential tolerance	±500 mV
Lead-off detection current	Measuring electrode: <0.1 μA Drive electrode: <1 μA
Input offset current	≤0.1 μA
Baseline recovery time	<5 s (after defibrillation)
Patient leakage current	<10 uA

Calibration signal	1mV (peak-to-peak value)
ESU protection	Cut mode: 300 W Coagulate mode: 100 W Recovery time: ≤10 s In compliance with the requirements in clause 4.2.9.14 of ANSI/AAMI EC 13:2002
ESU noise suppression	Based on the test method in clause 5.2.9.14 of EC 13:2002, use ECG lead wires which are in compliance with AAMI. Compared with ECG baseline, the noise of peak to peak value ≤2 mV.
Pace Pulse	
Pace pulse markers	Pace pulses meeting the following conditions are labelled with a PACE marker: Amplitude: ±2 to ±700 mV Width: 0.1 to 2 ms Rise time: 10 to 100 μs
Pace pulse rejection	When tested in accordance with the ANSI/AAMI EC13-2002: Sections 4.1.4.1 and 4.1.4.3, the heart rate meter rejects all pulses meeting the following conditions. Amplitude: ±2 to ±700 mV Width: 0.1 to 2 ms Rise time: 10 to 100 μs

Basic algorithm

HR			
Measurement range	3-, 5-, and 12-lead ECG	Neonate: Pediatric: Adult:	15 to 350 bpm 15 to 350 bpm 15 to 300 bpm
	12-lead analysis	Adult, pediatric:	30 to 120 bpm
Resolution	1 bpm		
Accuracy	3-, 5-, and 12-lead ECG: ±1 bpm or ±1%, whichever is greater. 12-lead analysis: ±2 bpm		
Sensitivity	200 μ V (lead II)		
HR averaging method	In compliance with the requirements in Clause 4.1.2.1 d）of ANSI/AAMI EC13-2002, the following method is used: If the last 3 consecutive RR intervals are greater than 1200 ms, the 4 most recent RR intervals are averaged to compute the HR. Otherwise, heart rate is computed by subtracting the maximum and minimum ones from the most recent 12 RR intervals and then averaging them.		

	The HR value displayed on the monitor screen is updated every second.
Response to irregular rhythm	In compliance with the requirements in Clause 4.1.2.1 e）of ANSI/AAMI EC13-2002, the heart rate after 20 seconds of stabilization is displayed as follows: Ventricular bigeminy (3a): -80±1 bpm Slow alternating ventricular bigeminy (3b): -60±1 bpm Rapid alternating ventricular bigeminy (3c): -120±1 bpm Bidirectional systoles (3d): -90±2 bpm
Response time to heart rate change	Meets the requirements of ANSI/AAMI EC13-2002: Section 4.1.2.1 f). From 80 to 120 bpm: less than 11 s From 80 to 40 bpm: less than 11 s
Time to alarm for tachycardia (not available in USA)	Meets the requirements of ANSI/AAMI EC13-2002: section 4.1.2.1 g). Waveform 4ah - range: 11 s 4a - range: 11 s 4ad - range: 11 s Waveform 4bh - range: 11 s 4b - range: 11 s 4bd - range: 11 s
Tall T-wave rejection capability	When the test is performed based on part 4.1.2.1 c)of ANSI/AAMI EC 13-2002, the heart rate meter will reject all 100 ms QRS complexes with less than 1.2 mV of amplitude, and T waves with T-wave interval of 180 ms and those with Q-T interval of 350 ms.
Arrhythmia Analysis Classifications (Not available in USA)	ASYSTOLE, VFIB/VTAC, COUPLET, BIGEMINY, TRIGEMINY, R ON T, VT>2, PVC, TACHY, BRADY, MISSED BEATS, PNP, PNC
ST Segment Analysis (Not available in USA)	
Measurement range	-2.0 to 2.0 mV
Accuracy	-0.8 to 0.8 mV: ±0.02 mV or ±10%, whichever is greater. Beyond this range: Not specified.
Refreshing rate	10 s

Mortara algorithm

Only the differences from the Basic algorithm are listed.

HR	
HR averaging method	In compliance with the requirements in Clause 4.1.2.1 d）of ANSI/AAMI EC13-2002, the following method is used: Heart rate is computed by averaging the most recent 16 RR intervals, unless the HR by averaging the most recent 4 heart beats is less than or equals to 48. The HR value displayed on the monitor screen is updated every second.
Time to alarm for tachycardia	Meets the requirements of ANSI/AAMI EC13-2002: section 4.1.2.1 g). Waveform 4ah – range: 4.30 to 5.34 s, average :4.75 s 4a – range: 3.94 to 5.92 s, average :4.69 s 4ad – range: 4.28 to 5.18 s, average :4.78 s 4bh – range: 3.5 to 8.22 s, average :4.83 s 4b – range: 3.09 to 4.11 s, average :3.64 s 4bd – range: 3.20 to 4.52 s, average :4.09 s
Arrhythmia Analysis Classifications	ASYSTOLE, VFIB, VTAC, VRHYTHM, COUPLET, VT>2, BIGEMINY, TRIGEMINY, R ON T, MULTIFORM PVCs, IRREFULAR, TACHY, BRADY, MISSED BEATS, PNP, PNC
ST Segment Analysis	
Refreshing rate	per 16 heartbeats

A.6.2 Resp

Technique	Trans-thoracic impedance	
Lead	Options are lead I and II. The default is lead II.	
Respiration excitation waveform	<300 μA, sinusoid, 62.8 kHz (±10%)	
Respiration impedance range	0.3 to 5 Ω	
Baseline impedance range	200 to 2500 Ω (using an ECG cable with 1kΩ resistance)	
Differential input impedance	>2.5 MΩ	
Bandwidth	0.2 to 2 Hz (-3 dB)	
Sweep speed	6.25 mm/s, 12.5 mm/s or 25 mm/s	
Respiration Rate		
Measurement range	Adult: 0 to 120 rpm Pediatric, neonate: 0 to 150 rpm	
Resolution	1 rpm	
Accuracy	7 to 150 rpm: ±2 rpm or ±2%, whichever is greater 0 to 6 rpm: Not specified.	
Apnea alarm time	10 s, 15 s, 20 s, 25 s, 30 s, 35 s, 40 s	
Alarm limit	**Range (rpm)**	**Step (rpm)**
RR High	(low limit + 2) to 100	1
RR Low	6 to (high limit – 2)	

A.6.3 SpO_2

Alarm limit	Range (%)	Step (%)
SpO2 High	(low limit + 1) to 100	1
SpO2 Low	Desat to (high limit – 1)	
Desat	50 to (high limit – 1)	

MPM SpO_2 Module

Standards	Meet standards of ISO9919		
***Measurement accuracy verification:** The SpO2 accuracy has been verified in human experiments by comparing with arterial blood sample reference measured with a CO-oximeter. Pulse oximeter measurement are statistically distributed and about two-thirds of the measurements are expected to come within the specified accuracy range compared to CO-oximeter measurements.			
Measurement range	0 to 100%		
Resolution	1%		
Accuracy	70 to 100%: ±2% (measured without motion in adult/pediatric mode) 70 to 100%: ±3% (measured without motion in neonate mode) 70 to 100%: ±3% (measured with motion) 0% to 69%: Not specified.		
*Studies were performed to validate the accuracy of Pulse Oximeter with neonatal SpO2 sensors by contrast with a CO-Oximeter. Some neonates aged from 1 day to 30 days with a gestation age of 22 weeks to full term were involved in this study. The statistical analysis of data of this study shows the accuracy (Arms) is within the stated accuracy specification. Please see the following table.			
Sensor type	**Totally neonates**	**Data**	**Arms**
518B	97 (51 male & 46 female)	200 pairs	2.38%
520N	122 (65 male & 57 female)	200 pairs	2.88%
The Pulse Oximeter with neonatal SpO2 sensors was also validated on adult subjects.			
Refreshing rate	1 s		
SpO_2 averaging time	7 s (When the sensitivity is set to High) 9 s (When the sensitivity is set to Medium) 11 s (When the sensitivity is set to Low)		

Masimo SpO_2 Module

SpO2	
Measurement range	1 to 100%
Resolution	1%
Accuracy	70 to 100%: ±2% (measured without motion in adult/pediatric mode) 70 to 100%: ±3% (measured without motion in neonate mode) 70 to 100%: ±3% (measured with motion) 0% to 69%: Not specified.
Refreshing rate	1 s
SpO_2 averaging time	2-4 s, 4-6 s, 8 s, 10 s, 12 s, 14 s, 16 s
Low perfusion conditions	Pulse amplitude: >0.02% Light penetration: >5%
Low perfusion SpO_2 accuracy	±2%

Nellcor SpO_2 Module

Parameter	Specifications		
SpO_2 measurement range and accuracy	Sensor	Range	Precision*
	MAX-A, MAX-AL, MAX-N MAX-P, MAX-I, MAX-FAST	70 to 100% 0% to 69%	±2% Not specified.
	OxiCliq A, OxiCliq N OxiCliq P, OxiCliq I	70 to 100% 0% to 69%	±2.5% Not specified.
	D-YS, DS-100A, OXI-A/N, OXI-P/I	70 to 100% 0% to 69%	±3% Not specified.
	MAX-R, D-YSE, D-YSPD	70 to 100% 0% to 69%	±3.5% Not specified.
Refreshing rate	1 s		
SPO_2 averaging time	8 s, 16 s		
*: When the SpO_2 sensor is applied for neonatal patients as indicated, the specified accuracy range is increased by ±1%, to compensate for the theoretical effect on oximeter measurements of fetal hemoglobin in neonatal blood.			

A.6.4 PR

Alarm limit	Range (bpm)	Step (bpm)
PR High	(low limit +2) to 240	1
PR Low	25 to (high limit-2)	

PR from MPM SpO_2 Module

Measurement range	20 to 254 bpm
Resolution	1 bpm
Accuracy	±3 bpm (measured without motion) ±5 bpm (measured with motion)
Refreshing rate	1 s
SPO2 averaging time	7 s (when sensitivity is set to High) 9 s (when sensitivity is set to Medium) 11 s (when sensitivity is set to Low)

PR from Masimo SpO_2 Module

Measurement range	25 to 240 bpm
Resolution	1 bpm
Accuracy	±3 bpm (measured without motion) ±5 bpm (measured with motion)
Refreshing rate	1 s
SPO2 averaging time	2-4 s, 4-6 s, 8 s, 10 s, 12 s, 14 s, 16 s
Low perfusion conditions	Pulse amplitude: ＞0.02% Light penetration: ＞5%
Low perfusion PR accuracy	±3 bpm

PR from Nellcor SpO_2 Module

Measurement range	20 to 300 bpm
Resolution	1 bpm
Accuracy	20 to 250 bpm: ±3 bpm 251 to 300 bpm, not specified
Refreshing rate	1 s
SPO2 averaging time	8 s, 16 s

PR from IBP Module

Measurement range	25 to 350 bpm
Resolution	1 bpm
Accuracy	25 to 200 bpm: ±1 bpm or ±1%, which is greater 201 to 350 bpm: ±2%
Refreshing rate	1 s

A.6.5 NIBP

Standards	Meet standards of EN60601-2-30/IEC60601-2-30, EN1060-1, EN1060-3，EN1060-4 and SP10			
Technique	Oscillometry			
Mode of operation	Manual, Auto and STAT			
Auto mode repetition intervals	1, 2, 3, 4, 5, 10, 15, 30, 60, 90, 120, 180, 240 or 480 min			
STAT mode cycle time	5 min			
Max measurement time	Adult, pediatric: 180 s Neonate: 90 s			
Heart rate range	40 to 240 bpm			
Measurement ranges (mmHg)		Adult	Pediatric	Neonate
	Systolic:	40 to 270	40 to 200	40 to 135
	Diastolic:	10 to 210	10 to 150	10 to 100
	Mean:	20 to 230	20 to 165	20 to 110
Accuracy	Max mean error: ±5 mmHg Max standard deviation: 8 mmHg			
Resolution	1mmHg			
Initial cuff inflation pressure	Adult: 178±5 mmHg Pediatric: 133±10 mmHg Neonate: 87±5 mmHg			
Software overpressure protection	Adult: 297±3 mmHg Pediatric: 240±3 mmHg Neonate: 147±3 mmHg			

Alarm limit	Range (mmHg)	Step (mmHg)
Sys High	Adult: (low limit+5) to 270 Pediatric: (low limit+5) to 200 Neonate: (low limit+5) to 135	5
Sys Low	40 to (high limit-5)	
Mean High	Adult: (low limit+5) to 230 Pediatric: (low limit+5) to 165 Neonate: (low limit+5) to 110	
Mean Low	20 to (high limit-5)	
Dia High	Adult: (low limit+5) to 210 Pediatric: (low limit+5) to 150 Neonate: (low limit+5) to 100	
Dia Low	10 to (high limit-5)	

***Measurement accuracy verification:** In adult and pediatric modes, the blood pressure measurements measured with this device are in compliance with the American National Standard for Electronic or Automated Sphymomanometers (ANSI/AAMI SP10-1992) in terms of mean error and stardard deviation by comparing with intra-arterial or auscultatory measurements (depending on the configuration) in a typical patient population. For auscultatory reference, the 5th Korotkoff sound was used to determine the diastolic pressure.
In neonatal mode, the blood pressure measurements measured with this device are in compliance with the American National Standard for Electronic or Automated Sphymomanometers (ANSI/AAMI SP10-1992 and AAMI/ANSI SP10A-1996) in terms of mean error and stardard deviation by comparing with intra-arterial measurements (depending on the configuration) in a typical patient population.

A.6.6 Temp

Standards	Meet standard of EN12470-4
Technique	Thermal resistance
Measurement range	0 to 50 °C (32 to 122 °F)
Resolution	0.1 °C
Accuracy	±0.1 °C or ±0.2 °F (without probe)
Refreshing rate	1 s
Minimum time for accurate measurement	Body surface: <100 s Body cavity: <80 s

Alarm limit	Range	Step
T1/T2 High	(low limit +1) to 50 °C (low limit +1) to 122 °F	0.1 °C 0.1 °F
T1/T2 Low	0 to (high limit -1.8) °C 32 to (high limit -1.8) °F	
TD High	0 to 50 °C 0 to 90 °F	

A.6.7 IBP

Standards	Meet standard of EN60601-2-34/IEC60601-2-34.
Technique	Direct invasive measurement
IBP	
Measurement range	-50 to 300 mmHg
Resolution	1 mmHg
Accuracy	±2% or ±1 mmHg, whichever is greater (without sensor)
Refreshing rate	1 s
Pressure transducer	
Excitement voltage	5 VDC, ±2%
Sensitivity	5 uV/V/mmHg
Impedance range	300 to 3000 Ω
Volume displacement (ABBOTT)	＜0.04 mm^3 /100 mmHg

Alarm limit		Range (mmHg)	Step (mmHg)
ART Ao FAP BAP UAP	Sys High	(low limit + 2) to 300	1
	Mean High		
	Dia High		
	Sys Low	0 to (high limit – 2)	
	Mean Low		
	Dia Low		
PA	Sys High	(low limit + 2) to 120	1
	Mean High		
	Dia High		

	Sys Low	-6 to (high limit – 2)	
	Mean Low		
	Dia Low		
CVP, LAP RAP, ICP	Mean High	(low limit + 2) to 40	1
	Mean Low	-10 to (high limit – 2)	
P1 to P8	Sys High	(low limit + 2) to 300	1
	Mean High		
	Dia High		
	Sys Low	-50 to (high limit – 2)	
	Mean Low		
	Dia Low		

A.6.8 C.O.

C.O. feature is not available in USA.

Measurement method	Thermodilution method	
Measurement range	C.O.:	0.1 to 20 L/min
	BT:	23 to 43°C
	TI:	0 to 27°C
Resolution	C.O.: BT, TI:	0.1 L/min 0.1°C
Accuracy	C.O.: BT, TI:	±5% or ±0.1 L /min, whichever is greater ±0.1°C (without sensor)
Alarm range	BT:	23 to 43°C

Alarm limit	**Range**	**Step**
BT High	(low limit + 1) to 43 °C (low limit + 1) to 109.4 °F	0.1 °C 0.1 °F
BT Low	23 to (high limit - 1) °C 73.4 to (high limit - 1.8) °F	

A.6.9 CO_2

Measurement mode	Sidestream, microstream, mainstream
Technique	Infrared absorption

Sidestream CO_2 Module

Standard	Meet standard of ISO 21647
CO_2 Measurement range	0 to 99 mmHg
Accuracy*	0 to 40 mmHg: ±2 mmHg 41 to 76 mmHg: ±5% of the reading 77 to 99 mmHg: ±10% of the reading
Accuracy drift	Meet the requirement for measurement accuracy within 6 hours
Resolution	1 mmHg
Sample flowrate	70 ml/min, 100 ml/min
Sample flowrate tolerance	15% or 15 ml/min, whichever is greater.
Warm-up time	＜1 min, enter the iso accuracy mode After 1 min, enters the full accuracy mode,
Response time	Measured with a neonatal watertrap and a 2.5-meter neonatal sampling line: ＜3.5 s @ 100 ml/min ＜4 s @ 70 ml/min Measured with a neonatal watertrap and a 2.5-meter adult sampling line: ＜5.5 s @ 100 ml/min ＜7 s @ 70 ml/min
Gas sampling delay time	Measured with a neonatal watertrap and a 2.5-meter neonatal sampling line: ＜3 s @ 100 ml/min ＜3.5 s @ 70 ml/min Measured with a neonatal watertrap and a 2.5-meter adult sampling line: ＜5 s @ 100 ml/min ＜6.5 s @ 70 ml/min
awRR measurement range	0 to 120 rpm
awRR measurement precision	0 to 70 rpm: ±2 rpm 71 to 120 rpm: ±5 rpm
Apnea time	10 s, 15 s, 20 s, 25 s, 30 s, 35 s, 40 s

Alarm limit	Range	Step
EtCO2 High	(low limit + 2) to 99 mmHg	1 mmHg
EtCO2 Low	0 to (high limit - 2)mmHg	
FiCO2 High	0 to 99 mmHg	
awRR High	(low limit + 2) to 100 rpm	1 rpm
awRR Low	6 to (high limit - 2) rpm	

* Accuracy applies for the following conditions:

1. Measurements begin after the CO_2 module warms up;
2. Ambient pressure is from 750 to 760 mmHg, and ambient temperature from 22 to 28ºC;
3. The measured gas is a dry gas and the balance gas N_2;
4. Gas sample flow rate is 100 ml/min, respiration rate is 50 rpm with a fluctuation between ±3 rpm, and I:E is 1:2.

When the operating temperature (near the module detector) is 15-25°C or 50-55°C, or the respiration rate is greater than 50 rpm, the measurement accuracy is: ±4 mmHg (0 to 40 mmHg) or 12% of the reading (41 to 99 mmHg).

Microstream CO_2 Module

Standard	Meet standard of ISO 21647
CO_2 Measurement range	0 to 99 mmHg
Accuracy*	0 to 38 mmHg: ±2 mmHg 39 to 99 mmHg: ±5% of the reading+0.08% of (the reading-38)
Accuracy drift	Meet the requirement for measurement accuracy within 6 hours
* Accuracy applies for respiration rate up to 80 rpm. For respiration rate above 80 rpm, the accuracy is 4 mmHg or ±12% of the reading, whichever is greater. for EtCO2 exceeding 18 mmHg. For respiration rate above 60 rpm, the above accuracy can be achieved by using the CapnoLine H Set for Infant/Neonatal. In the presence of interfering gases, the above accuracy is maintained to within 4%.	
Resolution	1 mmHg
Sample flow rate	$50^{-7.5}_{+15}$ ml/min
Initialization time	30 s (typical)
Response time	2.9 s (typical) (The response time is the sum of the rise time and the delay time when using a FilterLine of standard length) Rise time: <190 ms (10% to 90%) Delay time: 2.7 s (typical)

awRR measurement range	0 to 150 rpm
awRR measurement accuracy	0 to 70 rpm: ±1 rpm 71 to 120 rpm: ±2 rpm 121 to 150 rpm: ±3 rpm
Apnea alarm time	10 s, 15 s, 20 s, 25 s, 30 s, 35 s, 40 s

Alarm limit	Range	Step
EtCO2 High	(low limit + 2) to 99 mmHg	1 mmHg
EtCO2 Low	0 to (high limit - 2)mmHg	
FiCO2 High	0 to 99 mmHg	
awRR High	(low limit + 2) to 100 rpm	1 rpm
awRR Low	6 to (high limit - 2) rpm	

Mainstream CO_2 Module

Standard	Meet standard of ISO 21647
CO_2 Measurement range	0 to 150 mmHg

B EMC

The device meets the requirements of IEC 60601-1-2:2001+A1:2004.

Note

- **Using accessories, transducers and cables other than those specified may result in increased electromagnetic emission or decreased electromagnetic immunity of the patient monitoring equipment.**
- **The device or its components should not be used adjacent to or stacked with other equipment. If adjacent or stacked use is necessary, the device or its components should be observed to verify normal operation in the configuration in which it will be used.**
- **The device needs special precautions regarding EMC and needs to be installed and put into service according to the EMC information provided below.**
- **Other devices may affect this monitor even though they meet the requirements of CISPR.**
- **When the inputted signal is below the minimum amplitude provided in technical specifications, erroneous measurements could result.**

Guidance and Declaration - Electromagnetic Emissions		
The device is suitable for use in the electromagnetic environment specified below. The customer or the user of the device should assure that it is used in such an environment.		
Emission tests	**Compliance**	**Electromagnetic environment - guidance**
Radio frequency (RF) emissions CISPR 11	Group 1	The device uses RF energy only for its internal function. Therefore, its RF emissions are very low and are not likely to cause any interference in nearby electronic equipment.
RF emissions CISPR 11	Class A	The device is suitable for use in all establishments other than domestic and those indirectly connected to the public low-voltage power supply network that supplies buildings used for domestic purposes.
Harmonic emissions IEC61000-3-2	Class A	
Voltage Fluctuations/Flicker Emissions IEC 61000-3-3	Compliance P_{st} T_{dt} (ms) D_{max} (%) Dc (%)	

Guidance and Declaration - Electromagnetic Immunity			
The device is suitable for use in the electromagnetic environment specified below. The customer or the user of the device should assure that it is used in such an environment.			
Immunity test	**IEC60601 test level**	**Compliance level**	**Electromagnetic environment - guidance**
Electrostatic discharge (ESD) IEC 61000-4-2	±6 kV contact ±8 kV air	±6 kV contact ±8 kV air	Floors should be wood, concrete or ceramic tile. If floors are covered with synthetic material, the relative humidity should be at least 30%.
Electrical fast transient/burst IEC 61000-4-4	±2 kV for power supply lines ±1 kV I/O for input/output lines (>3 m)	±2 kV for power supply lines ±1 kV I/O for input/output lines (>3 m)	Mains power quality should be that of a typical commercial or hospital environment.
Surge IEC 61000-4-5	±1 kV differential mode ±2 kV common mode	±1 kV differential mode ±2 kV common mode	
Voltage dips, short interruptions and voltage variations on power supply input lines IEC 61000-4-11	<5 % U_T (>95 % dip in U_T) for 0.5 cycle 40 % U_T (60 % dip in U_T) for 5 cycles 70 % U_T (30 % dip in U_T) for 25 cycles <5 % U_T (>95 % dip in U_T) for 5 s	<5 % U_T (>95 % dip in U_T) for 0.5 cycle 40 % U_T (60 % dip in U_T) for 5 cycles 70 % U_T (30 % dip in U_T) for 25 cycles <5 % U_T (>95 % dip in U_T) for 5 s	Mains power quality should be that of a typical commercial or hospital environment. If the user of our product requires continued operation during power mains interruptions, it is recommended that our product be powered from an uninterruptible power supply or a battery.
Power frequency (50/60 HZ) magnetic field IEC 61000-4-8	3 A/m	3 A/m	Power frequency magnetic fields should be at levels characteristic of a typical location in a typical commercial or hospital environment.
Note: U_T is the AC mains voltage prior to application of the test level.			

Guidance and Declaration - Electromagnetic Immunity		
The device is suitable for use in the electromagnetic environment specified below. The customer or the user of the device should assure that it is used in such an environment.		
Immunity test	**IEC 60601 Test level**	**Compliance level**
Conduced RF IEC61000-4-6	3 Vrms 150k to 80M Hz	3 Vrms (BIS, ICG: 1Vrms)
Radiated RF IEC61000-4-3	3V/m 80M to 2.5G Hz	3V/m (Resp: 1V/m)
Electromagnetic environment - guidance		
Portable and mobile RF communications equipment should be used no closer to any part of the device, including cables, than the recommended separation distance calculated from the equation applicable to the frequency of the transmitter. Recommended Separation Distance: $d = 1.2\sqrt{P}$ (BIS, ICG: $d = 3.5\sqrt{P}$) $d = 1.2\sqrt{P}$ (Resp: $d = 3.5\sqrt{P}$) 80 to 800 MHz $d = 2.3\sqrt{P}$ 800M to 2.5GHz where P is the maximum output power rating of the transmitter in watts (W) according to the transmitter manufacturer and d is the recommended separation distance in meters (m). Field strengths from fixed RF transmitters, as determined by an electromagnetic site survey, [a] should be less than the compliance level in each frequency range [b] Interference may occur in the vicinity of equipment marked with the following symbol:  .		
Note 1: From 80 MHz to 800 MHz, the higher frequency range applies. Note 2: These guidelines may not apply in all situations. Electromagnetic propagation is affected by absorption and reflection from structures, objects and people.		
a Field strengths from fixed transmitters, such as base stations for radio (cellular/cordless) telephones and land mobile radios, amateur radio, AM and FM radio broadcast and TV broadcast cannot be predicted theoretically with accuracy. To assess the electromagnetic environment due to fixed RF transmitters, an electromagnetic site survey should be considered. If the measured field strength in the location in which the device is used exceeds the applicable RF compliance level above, the device should be observed to verify normal operation. If abnormal performance is observed, additional measures may be necessary, such as reorienting or relocating the device. b Over the frequency ranges 150kHz to 80MHz, field strengths should be less than 3V/m. For BIS and ICG monitoring, the field strength should be less than 1V/m		

Recommended Separation Distances between Portable and Mobile RF Communications Equipment and The device

The device is suitable for use in an electromagnetic environment in which radiated RF disturbance are controlled. The customer or the user of the device can help prevent electromagnetic interference by maintaining a minimum distance between portable and mobile RF communications equipment (transmitters) and the device as recommended below, according to the maximum output power of the communication equipment.

Rated Maximum Output power of Transmitter Watts (W)	**Separation Distance Meters (m) Corresponding to Frequency of Transmitter**		
	150k to 80MHz $d = 3.5\sqrt{P}$	80M to 800MHz $d = 3.5\sqrt{P}$	800M to 2.5GHz $d = \left[\frac{7}{3}\right]\sqrt{P}$
0.01	0.35	0.35	0.23
0.1	1.11	1.11	0.74
1	3.5	3.5	2.34
10	11.07	11.07	7.38
100	35	35	23.34

For transmitters at a maximum output power not listed above, the separation distance can be estimated using the equation in the corresponding column, where P is the maximum output power rating of the transmitter in watts (W) according to the transmitter manufacturer.

Note 1: From 80 MHz to 800 MHz, the separation distance for the higher frequency range applies.

Note 2: These guidelines may not apply in all situations. Electromagnetic propagation is affected by absorption and reflection from structures, objects and people.

C Factory Defaults

C.16 RM Setup

RM Setup	Factory default settings		
	Adult	**Pediatric**	**Neonate**
Alarm	On		
Alm Lev	Med		
Alm Rec	Off		
Apnea Time	20 s		
TV / MV	TV		
Sensor Type	Disposable		
Ventilation Mode	Spontaneous		
Alarm Limits Setup			
RR High	30	30	100
RR Low	8	8	30
PEEP High	10		
PEEP Low	0		
PIP High	40		
PIP Low	1		
MVe High	30.0	30.0	10.0
MVe Low	2.0	2.0	0.5
RM Waveform			
Sweep	6.25 mm/s		

D Alarm Messages

This chapter lists only the most important physiological and technical alarm messages. Some messages appearing on your monitor may not be included.

In this chapter:

- The “A” field indicates whether all alarm indications can be cleared or not, and the “B” field indicates whether all alarm indications except the alarm message can be cleared or not.
- The “L” field indicates the alarm level: H means high, M means medium and L means low. “*” means the alarm level is user-adjustable.
- XX represents a measurement or parameter label, such as ECG, NIBP, HR, ST-I, PVCs, RR, SpO_2, PR, etc.

In the “Cause and Solution” column, corresponding solutions are given instructing you to troubleshoot problems. If the problem persists, contact your service personnel.

D.1 Physiological Alarm Messages

Measurement	Alarm messages	L	Cause and solution
XX	XX Too High	M*	XX value has risen above the high alarm limit or fallen below the low alarm limit. Check the patient's condition and check if the patient category and alarm limit settings are correct.
	XX Too Low	M*	
ECG	ECG Weak Signal	H	The ECG signal is so weak that the monitor can't perform ECG analysis. Check the patient's condition and the ECG connections.
	Asystole	H	Arrhythmia has occurred to the patient. Check the patient's condition and the ECG connections.
	VFib/VTac	H	
	R on T	M*	
	VT>2	M*	
	Couplet	M*	
	PVC	M*	
	Bigeminy	M*	
	Trigeminy	M*	
	Tachy	M*	
	Brady	M*	
	Missed Beats	M*	
	Irr. Rhythm	M*	
	Vent. Rhythm	M*	
	Multif. PVC	M*	
	PNP	M*	The pacer appears abnormal. Check the pacer.
	PNC	M*	
Resp	Resp Apnea	H	The respiration signal was so weak that the monitor cannot perform respiration analysis. Check the patient's condition and the Resp connections.
	Resp Artifact	H	The patient's heartbeat has interfered with his respiration. Check the patient's condition and the Resp connections.
SpO_2	SpO2 Desat	H	The SpO2 value has fallen below the desaturation alarm limit. Check the patient's condition and check if the alarm limit settings are correct.
	No Pulse	H	The pulse signal was so weak that the monitor cannot perform pulse analysis. Check the patient's condition, SpO_2 sensor and measurement site.

Measurement	Alarm messages	L	Cause and solution
CO_2	CO_2 Apnea	H	The patient stops breathing, or the respiration signal was so weak that the monitor cannot perform respiration analysis. Check the patient's condition and the RM connections.
AG	AG Apnea	H	
RM	RM Apnea	H	
AG	FiO2 Too Low	H	Check the patient's condition, the ventilated O_2 content and the AG connections.

D.2 Technical Alarm Messages

Measurement	Alarm message	A	B	Cause and solution
XX	XX SelfTest Err	√	×	An error occurred to the XX module, or there is a problem with the communications between the module and the monitor. Re-plug the module and restart the monitor, or plug the module into another monitor.
	XX Init Err	√	×	
	XX Init Err N	√	×	
	N is within 1 to 8			
	XX Comm Err	√	×	
	XX Comm Stop	×	×	
	XX Limit Err	×	×	XX parameter limit is accidentally changed. Contact your service personnel.
	XX Overrange	×	×	The measured XX value is not within the specified range for XX measurement. Contact your service personnel.
MPM	MPM 12V Err	×	×	An error occurred to the power supply part of the MPM module. Contact your service personnel.
	MPM 5V Err	×	×	
ECG	ECG Lead Off	×	√	The electrode has become detached from the patient or the lead wire has become disconnected from the adapter cable. Check the connections of the electrodes and leadwires.
	ECG YY Lead Off	×	√	
	Note: YY represents the leadwires, V (V1, V2, V3, V4, V5, V6,), LL, LA, RA, as per AHA standard, or C (C1, C2, C3, C4, C5, C6), F, L and R as per IEC standard.			
	ECG Noisy	√	×	The ECG signal is noisy. Check for any possible sources of signal noise around the cable and electrode, and check the patient for great motion.

Measurement	Alarm message	A	B	Cause and solution
	ECG Artifact	√	×	Artifacts are detected on the ECG analysis lead and as a result heart rate cannot be calculated and Asystole, Vfib and Vtac cannot be analyzed. Check the connections of the electrodes and leadwires and check for any possible source of interference around the cable and electrode. Check the patient's condition and check the patient for great motion.
	ECG High Freq. Noise	√	×	High frequency signals are detected on the ECG analysis lead. Check for any possible source of interference around the cable and electrode.
	ECG Low Freq. Noise	√	×	Low frequency signals are detected on the ECG analysis lead. Check for any possible source of interference around the cable and electrode.
	ECG Amplitude Too Small	×	×	The ECG amplitude didn't reach the detected threshold. Check for any possible source of interference around the cable and electrode.
	ECG Config. Err	×	×	ECG configuration is wrongly downloaded. Check the downloaded configuration and re-download the correct configuration.
Resp	Resp Disturbed	√	×	The respiration circuit is disturbed. Restart the monitor.
Temp	Temp Cal. Err	×	×	A calibration failed. Restart the monitor.
	T1 Sensor Off	√	×	The Temp sensor has become detached from the patient or the module. Check the sensor connections.
	T2 Sensor Off	√	×	
SpO_2	SpO2 Sensor Off	×	√	The SpO_2 sensor has become detached from the patient or the module, or there is a fault with the SpO_2 sensor, or an unspecified SpO_2 sensor has been used. Check the sensor application site and the sensor type, and make sure if the sensor is damaged. Reconnect the sensor or use a new sensor.
	SpO2 Sensor Fault	×	×	
	SpO2 No Sensor	√	×	
	SpO2 Unrecognized Sensor	×	×	
	SpO2 Sensor Incompatible	×	×	
	SpO_2 Too Much Light	×	×	There is too much light on the SpO_2 sensor. Move the sensor to a place with lower level of ambient light or cover the sensor to minimize the ambient light.
	SpO2 Low Signal	×	×	The SpO2 signal is too low or too weak. Check the patient's condition and change the sensor
	SpO2 Weak Signal	×	×	

Measurement	Alarm message	A	B	Cause and solution
	SpO2 Weak Pulse	×	×	application site. If the error persists, replace the sensor.
	SpO2 Low Perf	×	×	
	SpO2 Interference	×	×	The SpO2 signal has been interfered. Check for any possible sources of signal noise around the sensor and check the patient for great motion.
	SpO2 Board Fault	×	×	There is a problem with the SpO_2 measurement board. Do not use the module and contact your service personnel.
NIBP	NIBP Loose Cuff	√	×	The NIBP cuff is not properly connected, or there is a leak in the airway.
	NIBP Air Leak	√	×	
	NIBP Pneumatic Leak	√	×	Check the NIBP cuff and pump for leakages.
	NIBP Cuff Type Wrong	√	×	The cuff type applied mismatches the patient category. Verify the patient category and replace the cuff.
	NIBP Air Pressure Err	√	×	An error occurred to the air pressure. Verify that the monitor application site meets the environmental requirements and check if there is any source that affects the air pressure.
	NIBP Weak Signal	√	×	The patient's pulse is weak or the cuff is loose. Check the patient's condition and change the cuff application site. If the error persists, replace the cuff.
	NIBP Signal Saturated	√	×	The NIBP signal is saturated due to excess motion or other sources.
	NIBP Overrange	√	×	The measured NIBP value is not within the specified range.
	NIBP Excessive Motion	√	×	Check the patient's condition and reduce the patient motion.
	NIBP Cuff Overpress.	√	×	The NIBP airway may be occluded. Check the airway and measure again.
	NIBP Equip Err	√	×	An error occurred during NIBP measurement and therefore the monitor cannot perform analysis correctly. Check the patient's condition and NIBP connections, or replace the cuff.
	NIBP Timeout	√	×	
	NIBP Measure Failed	√	×	
	NIBP Illegally Reset	√	×	An illegal reset occurred during NIBP measurement. Check if the airway is occluded.
IBP	YY Sensor Off	√	×	Check the sensor connection and reconnect the sensor.
	YY represents an IBP label.			

Measurement	Alarm message	A	B	Cause and solution
C.O.	BT Sensor Off	√	×	
CO2	CO_2 Sensor Off	√	×	
	CO_2 Internal Comm Err	√	×	There is a problem with the communication between the CO_2 module and the monitor.
	CO_2 Sensor High Temp	×	×	Check, stop using or replace the sensor.
	CO_2 Sensor Low Temp	×	×	Check, stop using or replace the sensor.
	CO_2 Airway High Press.	×	×	An error occurred in the airway pressure. Check the patient connection and patient circuit, and then restart the monitor.
	CO_2 Airway Low Press.	×	×	
	CO_2 High Barometric Press.	×	×	Check the CO2 connections, make sure that the monitor application site meets the requirements, and check for special sources that affect the ambient pressure. Restart the monitor.
	CO_2 Low Barometric Press.	×	×	
	CO_2 FilterLine Occluded	×	×	The airway or watertrap was occluded. Check the airway and remove the occlusion.
	CO_2 Watertrap Occluded	×	×	
	CO_2 No Watertrap	×	√	Check the watertrap connections.
	CO_2 Signal Saturated	√	×	There is a problem with the CO2 signal quality. Check the CO2 connections.
	CO_2 Signal Low	√	×	
	CO_2 Signal Too Low	√	×	
	CO_2 Signal Noisy	√	×	
	CO_2 Calc. Err	√	×	
	CO_2 Check Adapter	√	×	There is a problem with the airway adapter. Check, clean or replace the adapter.
	CO_2 FilterLine Err	×	×	Check if there is a leak in the CO_2 sample line or the CO_2 sample line has been occluded.
	CO_2 Zero Failed	√	×	Check the CO_2 connections. After the sensor's temperature becomes stabilized, perform a zero calibration again.
	CO_2 System Err	√	×	Re-plug the module or restart the monitor.
	CO_2 Check Cal.	×	×	Perform a calibration.
	CO_2 Check Airway	×	×	An error occurred to the airway.
	CO_2 No Filterline	√	×	Make sure that the filterline is connected.
	CO_2 Main Board Err	×	×	There is a problem with the CO_2 module. Re-plug the module or restart the monitor.
	CO_2 Check Sensor or Main Board	×	×	

Measurement	Alarm message	A	B	Cause and solution
	CO_2 Replace Scrubber&Pump	×	×	
	CO_2 Change Sensor	×	×	
	CO_2 15V Overrange	×	×	
	CO_2 Hardware Err	×	×	
	CO_2 Pump Fault	×	×	
	CO_2 Pneumatic Leak	√	×	
	CO_2 Malfunction	×	×	
	CO_2 Reverse Flow	×	×	The gas inlet has been connected to a negative pressure source or vacuum device and therefore the module works abnormally when the pump starts up. Check the gas inlet.
	CO_2 Forward Flow	×	×	The gas inlet has been connected to a positive pressure source or an airflow source and therefore the module works abnormally when the pump starts up. Check the gas inlet.
AG	CO_2 Sensor Off	√	×	Check the connections of the sensor and re-connect it.
	AG No Watertrap	×	√	Check the connections of the watertrap and re-connect it.
	AG Change Watertrap	√	×	Wait until the change is completed.
	AG Watertrap Type Wrong	√	×	Make sure that a correct watertrap has been used.
	O2 Accuracy Unspecified	×	√	The measured value has exceeded the specified accuracy range.
	N2O Accuracy Unspecified	√	×	
	CO2 Accuracy Unspecified	√	×	
	Enf Accuracy Unspecified	√	×	
	Iso Accuracy Unspecified	√	×	
	Sev Accuracy Unspecified	√	×	
	Hal Accuracy Unspecified	√	×	
	Des Accuracy Unspecified	√	×	
	RR Accuracy Unspecified	√	×	
	O2 Sensor Err	√	×	An error occurred to the module. Re-plug the module or restart the monitor.
	Galvanic O2 Sensor Err	√	×	

Measurement	Alarm message	A	B	Cause and solution
	AG Hardware Err	√	×	
	AG Hardware Malf.	×	×	Remove the AG module. Stop using the module and contact your service personnel.
	AG Airway Occluded	√	×	Check the airway and remove the occlusion.
	AG Zero Failed	√	×	Re-plug the module or restart the monitor, and then perform a zero calibration again.
	AG Oxima Depletion Err	√	×	Contact your service personnel and replace the O2 battery.
	AG Oxima Depletion Warn	√	×	
	AG Accuracy Err	√	×	The measured value has exceeded the specified accuracy range.
	AG Cal. Failed	√	×	Re-calibrate the AG module.
RM	RM No Sensor	√	×	Check and reconnect the sensor.
	RM Sensor Reversed	×	×	
	RM Zero Failed	×	×	Perform a zero calibration again.
	RM Power Err	×	√	There is a problem with the power supply. Re-plug the module or restart the monitor.
BIS	BIS High Imped.	√	×	Check and reconnect the BIS sensor.
	BIS Sensor Off	√	×	
	BIS DSC Err	×	×	An error occurred to the DSC during receiving signals. Check the DSC.
	BIS DSC Malf	×	×	The DSC automatically shuts down as a result of malfunction. Check the DSC.
	BIS No Cable	√	×	Check the BIS cables.
	BIS No Sensor	√	×	Check the BIS sensor.
	BIS Wrong Sensor Type	√	×	Check or replace the sensor.
	BIS Sensor Too Many Uses	√	×	Replace the sensor.
	SQI<50%	√	×	The SQI value is too low. Check the patient's condition and the sensor connections.
	SQI<15%	√	×	
	BIS Sensor Expired	√	×	Replace the sensor.
	BIS Sensor Fault	×	×	Re-attach or Replace BIS Sensor
	Disconnect/Reconnect BIS	×	×	Re-plug the BIS Module
ICG	ICG Low Quality Signal	√	×	Check and reconnect the sensor.
	ICG Left Neck Sensor Off	√	×	

Measurement	Alarm message	A	B	Cause and solution
	ICG Right Neck Sensor Off	√	×	
	ICG L. Thorax Sensor Off	√	×	
	ICG R. Thorax Sensor Off	√	×	
	ICG Sensor Off	√	×	
Power	12V Too High	×	×	There is a problem with the system power supply. Restart the monitor.
	12V Too Low	×	×	
	5V Too High	×	×	
	5V Too Low	×	×	
	3.3V Too High	×	×	
	3.3V Too Low	×	×	
	Battery Too Low	×	×	Connect the monitor to an AC power source and allow the batteries to charge.
	Different Battery Voltages	×	×	The two batteries have different charge capacity, or the batteries unspecified have been used, or there is a problem with the batteries. Make sure that correct batteries are used and the batteries are not damaged, or replace the batteries.
	Battery Incompatible	×	×	
	Battery Error	×	×	
	Cell Battery Too High	×	×	There is a problem with the power supply for the realtime clock. Restart the monitor.
	Cell Battery Too Low	×	×	
	Battery Power Overload	×	×	The power consumption of the equipment is too high. Power the monitor using an AC power source.
	RT Clock Need Reset	×	×	Re-set the system time and restart the monitor.
	RT Clock Not Exist	×	×	Contact your service personnel.
	Charger Error	×	×	Contact your service personnel.
Recorder	Recorder Init Err N	√	×	Restart the monitor.
	N is within 1 to 8.			
	Recorder SelfTest Err	√	×	Stop the recording and restart the monitor.
	Recorder Comm Err	√	×	
	Recorder S. Comm Err	√	×	
	Recorder Unavailable	×	×	
	Recorder Vlt High	×	×	An error occurred to the system power supply. Restart the monitor.
	Recorder Vlt Low	×	×	

Measurement	Alarm message	A	B	Cause and solution
	Recorder Head Hot	×	×	The recorder has been working for too long time. Stop the recording and resume the recording till the recorder's printhead cools down.
	Rec Paper Wrong Pos.	√	×	Re-load the recorder paper.
System	System Watchdog Err	√	×	An error occurred to the system. Restart the monitor.
	System Software Err	√	×	
	System CMOS Full	√	×	
	System CMOS Err	√	×	
	System FPGA Err	√	×	
	System Err N	√	×	
	N is within 2 to 12.			
	Keyboard Init Err	×	×	Re-plug the keyboard and restart the monitor.
	Keyboard Unavailable	×	×	
	Keyboard Comm Err	×	×	
	Keyboard failed. Please shut down!	×	×	
	Key Error	×	×	An error occurred to the system. Restart the monitor.
	System Bus Err	×	×	
	Net Bus Err	×	×	
	Net Init Err	√	×	
	System Connected	√	×	The monitor is successfully connected to the monitoring network.
	System Not Connected	√	×	Check the connection of the network cable and contact the network administrator.
	SMR Unavailable	×	×	Turn off the monitor and check the connection between the satellite module rack (SMR) and the monitor, and then restart the monitor.
	Net Comm Error	×	×	Check the network connections and contact the network administrator.

E Symbols and Abbreviations

E.1 Symbols

µA	microampere
µV	microvolt
A	ampere
Ah	ampere hour
bpm	beat per minute
bps	bit per second
ºC	centigrade
cc	cubic centimeter
cm	centimeter
dB	decibel
DS	dyne second
ºF	fahrenheit
g	gram
GHz	gigahertz
GTT	gutta
h	hour
Hz	hertz
in	inch
kg	kilogram
kPa	kilopascal
L	litre
lb	pound
m	meter
mAh	microampere hour
Mb	mega byte
mcg	microgram
mEq	milli-equivalents
mg	milligram
min	minute
ml	milliliter
mm	millimeter
mmHg	millimeters of mercury
ms	millisecond
mV	millivolt
mW	milliwatt
MΩ	megaohm

nm	nanometer
rpm	breath per minute
s	second
V	volt
VA	volt ampere
Ω	ohm
W	watt
–	minus, negative
%	percent
/	per; divide; or
+	plus
=	equal to
<	less than
>	greater than
≤	less than or equal to
≥	greater than or equal to
±	plus or minus
×	multiply

E.2 Abbreviations

$AaDO_2$	alveolar-arterial oxygen gradient
AAMI	Association for Advancement of Medical Instrumentation
AC	alternating current
ACI	acceleration index
Adu	adult
AG	anaesthesia gas
AHA	American Heart Association
ANSI	American National Standard Institute
Ao	aortic pressure
Art	arterial
aVF	left foot augmented lead
aVL	left arm augmented lead
aVR	right arm augmented lead
awRR	airway respiratory rate
BAP	brachial arterial pressure
BIS	bispectral index
BP	blood pressure
BPSK	binary phase shift keying
BSA	body surface area
BT	blood temperature
BTPS	body temperature and pressure, saturated
C.I.	cardiac index
C.O.	cardiac output
CaO_2	arterial oxygen content
CCO	continuous cardiac output
CCU	cardiac (coronary) care unit
CE	Conformité Européenne
CIS	Clinical Information System
CISPR	International Special Committee on Radio Interference
CMOS	complementary metal oxide semiconductor
CMS	central monitoring system
C.O.	cardiac output
CO_2	carbon dioxide
COHb	carboxyhemoglobin
CP	cardiopulmonary
CVP	central venous pressure
DC	direct current
Des	desflurane
Dia	diastolic
DPI	dot per inch

DVI	digital video interface
ECG	electrocardiograph
EDV	end-diastolic volume
EEC	European Economic Community
EEG	electroencephalogram
EMC	electromagnetic compatibility
EMG	electromyography
EMI	electromagnetic interference
Enf	enflurane
ESU	electrosurgical unit
Et	end-tidal
$EtCO_2$	end-tidal carbon dioxide
EtN_2O	end-tidal nitrous oxide
EtO	ethylene oxide
EtO_2	end-tidal oxygen
FAP	femoral atrial pressure
FCC	Federal Communication Commission
FDA	Food and Drug Administration
FEV1.0%	first second forced expiratory volume ratio
Fi	fraction of inspired
$FiCO_2$	fraction of inspired carbon dioxide
FiN_2O	fraction of inspired nitrous oxide
FiO_2	fraction of inspired oxygen
FPGA	field programmable gate array
FV	flow-volume
Hal	halothane
Hb	hemoglobin
Hb-CO	carbon mono-oxide hemoglobin
HbO_2	oxyhemoglobin
HR	heart rate
I:E	inspiratory-expiratory ratio
IBP	invasive brood pressure
ICG	impedance cardiography
ICP	intracranial pressure
ICT/B	intracranial catheter tip pressure transducer
ICU	intensive care unit
ID	identification
IEC	International Electrotechnical Commission
IEEE	Institute of Electrical and Electronic Engineers
Ins	inspired minimum
IP	internet protocol
Iso	isoflurane
IT	injectate temperature
LA	left arm

LAP	left atrial pressure
Lat	lateral
LCD	liquid crystal display
LCW	left cardiac work
LCWI	left cardiac work index
LED	light emitting diode
LL	left leg
LVD	low voltage directive
LVDS	low voltage differential signal
LVET	left ventricular ejection time
LVSW	left ventricular stroke work
LVSWI	left ventricular stroke work index
MAC	minimal alveolar concentration
Art mean	mean arterial pressure
MDD	Medical Device Directive
MetHb	methemoglobin
MRI	magnetic resonance imaging
MVe	expiratory minute volume
MVi	inspiratory minute volume
N/A	not applied
N_2	nitrogen
N_2O	nitrous oxide
Neo	neonate
NIBP	noninvasive blood pressure
NIP	negative inspiratory pressure
O_2	oxygen
O_2CI	oxygen consumption index
O_2R	oxygen extraction ratio
OR	operating room
oxyCRG	oxygen cardio-respirogram
PA	pulmonary artery
Paw	airway pressure
PAWP	pulmonary artery wedge pressure
PD	photodetector
Ped	pediatric
PEEP	positive end expiratory pressure
PEF	peak expiratory flow
PEP	pre-ejection period
PIF	peak inspiratory flow
PIP	peak inspiratory pressure
Pleth	plethysmogram
Pmean	mean pressure
Pplat	plateau pressure
PR	pulse rate

PVC	premature ventricular complex
PVR	pulmonary vascular resistance
PVRI	pulmonary vascular resistance index
R	right
RA	right arm
RAM	random access memory
RAP	right atrial pressure
Raw	airway resistance
Rec	record, recording
Resp	respiration
RHb	reduced hemoglobin
RL	right leg
RM	respiratory mechanics
RR	respiration rate
RSBI	rapid shallow breathing index
SaO_2	arterial oxygen saturation
SEF	spectral edge frequency
Sev	sevoflurane
SFM	self-maintenance
SI	stroke index
SMR	satellite module rack
SpO_2	arterial oxygen saturation from pulse oximetry
SQI	signal quality index
SR	suppression ratio
STR	systolic time ratio
SV	stroke volume
SVR	systemic vascular resistance
SVRI	systemic vascular resistance index
Sync	synchronization
Sys	systolic pressure
Taxil	axillary temperature
TD	temperature difference
Temp	temperature
TFC	thoracic fluid content
TFI	thoracic fluid index
TFT	thin-film technology
Toral	oral temperature
TP	total power
Trect	rectal temperature
TVe	expiratory tidal volume
TVi	inspiratory tidal volume
UAP	umbilical arterial pressure
UPS	uninterruptible power supply
USB	universal serial bus

UVP	umbilical venous pressure
VAC	volts alternating current
VEPT	volume of electrically participating tissue
VI	velocity index
WLAN	wireless local area network
WOB	work of breathing
